Does Anne Hathaway News Drive Berkshire Hathaway's Stock?

ALEXIS C. MADRIGAL | MAR 10, 2011 | TECHNOLOGY

TEXT SIZE − +

Like *The Atlantic*? Subscribe to The Atlantic Daily, our free weekday email newsletter. Email SIGN UP

Given the awesome correlating powers of today's stock trading computers, the idea may not be as far-fetched as you think.

A couple weeks ago, Huffington Post blogger Dan Mirvish noted a funny trend: when Anne Hathaway was in the news, Warren Buffett's Berkshire Hathaway's shares went up. He pointed to six dates going back to 2008 to show the correlation. Mirvish then suggested a mechanism to explain the trend: "automated, robotic trading programming are picking up the same chatter on the Internet about 'Hathaway' as the IMDb's StarMeter, and they're applying it to the stock market."

https://www.theatlantic.com/technology/archive/2011/03/does-anne-hathaway-news-drive-berkshire-hathaways-stock/72661/

Other classification applications

- Spam filtering
- Authorship id
  - Age id
  - Gender id
  - Native speaker id
  - First language id
- Auto tagging (information retrieval)
- Trend analysis
  - Patent landscape

Text classification definition

- Input
  - Set of documents: D = $\{d_1, d_2, d_3, \ldots, d_M\}$
    - Each document is composed of words
      - d1 = $[w_{11}, w_{12}, \ldots w_{1N}]$
  - Set of classes: C = $\{c_1, c_2, c_3, .., c_J\}$

- Output
  - The predicted class c from the set C

Rule-based classification

- Rules based on phrases or other features
  - Wongnai Rating
    - แมลงสาบ -> 2 ดาว
    - อร่อย -> 4 ดาว
    - ไม่อร่อย -> 2 ดาว
    - …
  - What if the phrase is ไม่ค่อยอร่อย
  - New rule
    - อร่อย โดยที่ไม่มีคำว่าไม่อยู่แถวๆนั้น -> 4 ดาว
  - What if the phrase is ไม่ถูกแต่อร่อย
- This can yield very good results but…
- Building and maintaining rules is expensive!
- Or keep a word list of positive and negative words

Supervised text classification definition

- Input
  - Set of documents: D = $\{d_1, d_2, d_3, \ldots, d_M\}$
  - And labels $Y = \{y_1, y_2, y_3, \ldots, y_M\}$
    - Each document is composed of words
      - $d1 = [w_{11}, w_{12}, \ldots w_{1N}]$
  - Set of classes: $C = \{c_1, c_2, c_3, .., c_J\}$

- Output
  - A classifier H: d -> c

What classifier?

- Any classifier you like
- k-NN
- Naïve Bayes
- Logistic regression
- SVM
- Neural networks

We use this kind of classifier before in previous homeworks

Outline

- Naïve Bayes

Bayes' Rule for classification

- A simple classification model
- Given document d, find the class c
  - Argmax P(c|d)
    c

$$= \underset{c}{\text{Argmax}} \frac{P(d|c)\,P(c)}{P(d)}$$

Bayes' Rule

$$= \underset{c}{\text{Argmax}}\, P(d|c)\,P(c)$$

P(d) is constant wrt to c

$$= \underset{c}{\text{Argmax}}\, P(x_1, x_2, \ldots, x_n \mid c)\,P(c)$$

The document is represented by features $x_1, x_2, \ldots, x_n$

Bayes' Rule for classification

- A simple classification model
- Given document d, find the class c
  - Argmax P(c|d)
    c

$$= \underset{c}{\text{Argmax}} \frac{P(d|c)\,P(c)}{P(d)}$$

$$= \underset{c}{\text{Argmax}}\, P(d|c)\,P(c)$$

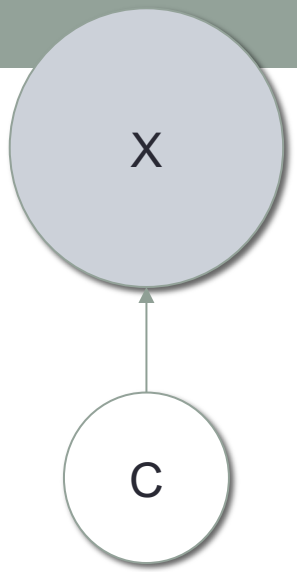
likelihood prior

$$= \underset{c}{\text{Argmax}}\, P(x_1, x_2, \ldots, x_n \mid c)\,P(c)$$

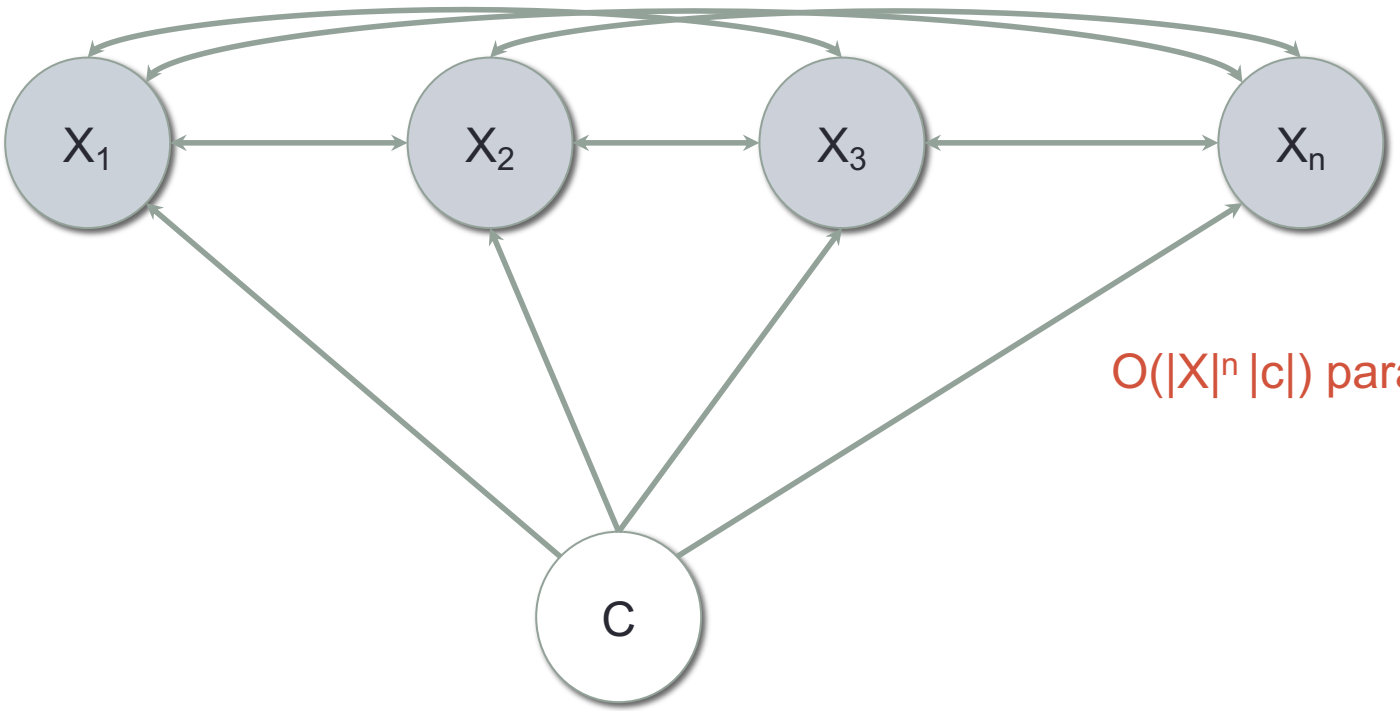
$P(x_1, x_2, \ldots, x_n \mid c)$ requires $O(|X|^n\,|c|)$ parameters. Cannot train

Graphical view

- $P(x_1, x_2, \ldots, x_n \mid c)\, P(c)$



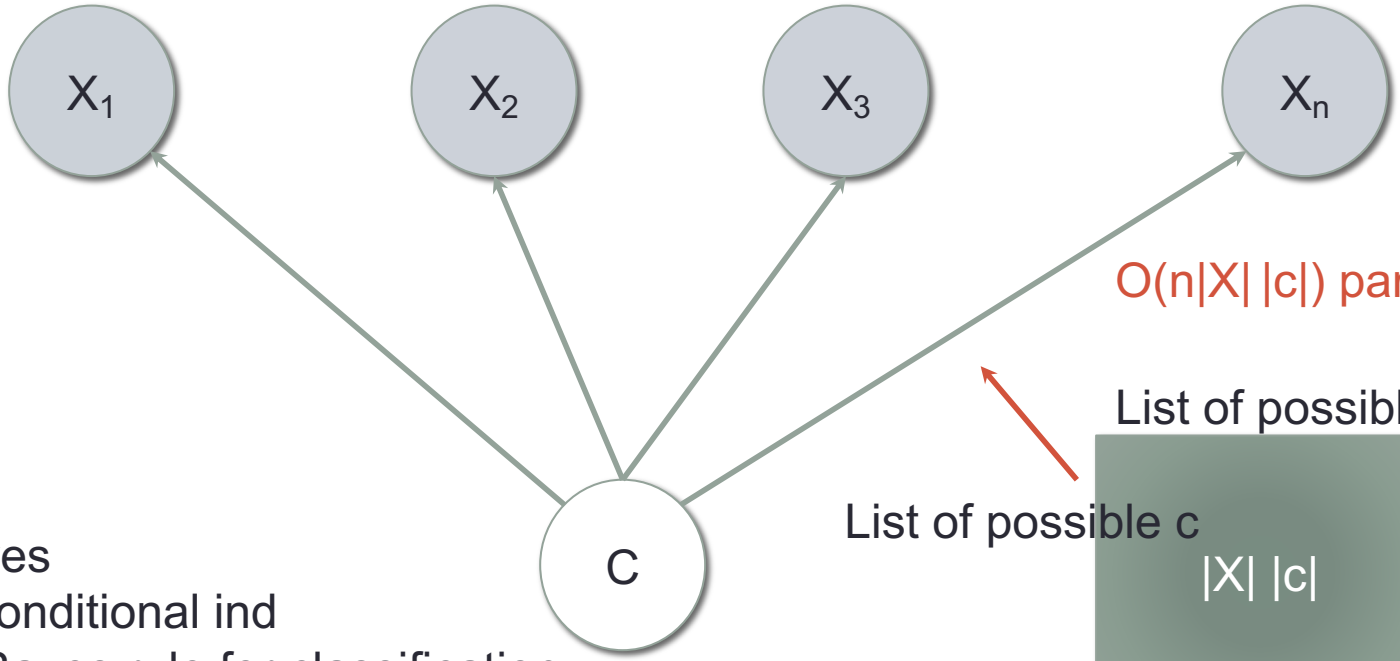
Xs are fully-connected



$O(|X|^n\, |c|)$ parameters

Bag of words assumption

- $P(x_1, x_2, \ldots, x_n \mid c)\, P(c) = P(x_1|c)\, P(x_2|c)\, P(x_3|c) \ldots P(x_n|c)\, P(c)$
  - Conditional independence



Naïve Bayes
Naïve – conditional ind
Bayes – Bayes rule for classification

Bags of words and NB

Probability of drawing words from the bag

Word	Distribution (class=1)
ชอบ	0.1
อร่อย	0.1
ไม่	0.5
กลมกล่อม	0.2
ทานง่าย	0.1

P(“ไม่อร่อยไม่ชอบ”| c = 1)

= P(ไม่ | c= 1) P(อร่อย | c= 1) P(ไม่ | c= 1) P(ชอบ | c= 1)

= 0.5 * 0.1 * 0.5* 0.1

Learning the Naïve Bayes model

- As usual counts
- P(x|c)
- $P(x = \text{“ยอด”} \mid c=5) = \frac{count(x = \text{“ยอด”}, c = 5)}{count(c = 5)}$
- P(c)
- $P(c = 5) = \frac{count\ (c = 5)}{count\ (all\ reviews)}$

x_n is a feature that counts word occurrence
x_1 how many times ยอด appear

List of possible counts

List of classes |X| |c|

- This is the Maximum Likelihood Estimate (MLE)

Learning the Naïve Bayes model

- What if we encounter zeroes in our table
- P(x|c)
- P(x = "ยอด"| c=5) = $\frac{\text{count}(x = \text{"ยอด"}, c = 5)}{\text{count}(c = 5)}$

x_n is a feature that counts word occurrence
x_1 how many times ยอด appear

List of possible counts

List of classes

|X| |c|

- P('ร้าน นี้ ราด หน้า ยอด ผัก ไม่ อร่อย'|c = 2)
  = P(x= "ร้าน"|c=2)*P(x= "นี้"|c=2)… P(x= "ยอด"|c=2) *...
  = 0

Zero probability regardless of other words

One solution: add-1 smoothing (a hyperparameter to tune)

What about unknown words (OOV)? Drop them (no calculation)

Naives Bayes

- Can use other features beside word counts
  - Feature engineering – restaurant name, location, price range, reviewer id, date of review
  - Tedious but very powerful
    - Features > 10000
- Pros: very fast, very small model
- Need to remove stop words
- Robust especially for small training data (hand-crafted rules)
- A good fast baseline. Always try Naive Bayes or logistic regression in model search.
- Even with lots of data and rich features, Naives Bayes can be very competitive and fast!

Naive Bayes vs Logistic regression Generative vs Discriminative modeling

Given data x, predict y

- Naïve Bayes are generative models

$$y^* = argmax_y \frac{P(x|y)P(y)}{P(x)}$$

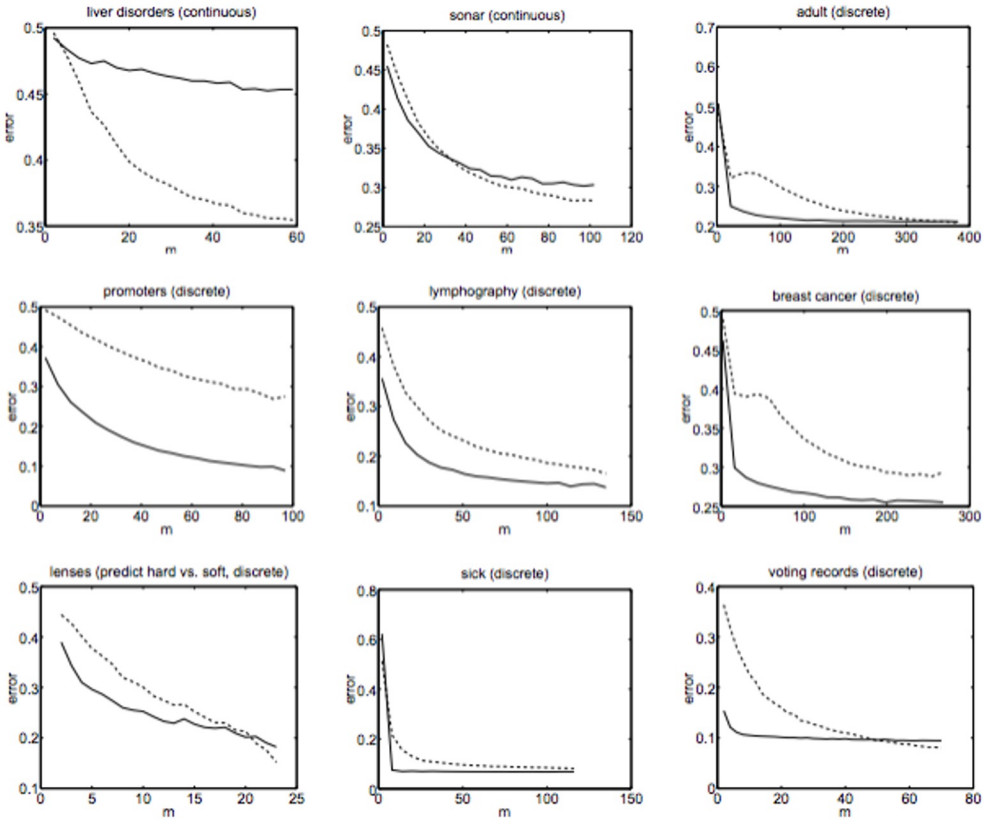
- Logistic regression are discriminative models
  - Note P(y|x) can be any function that outputs y given x (a neural network)

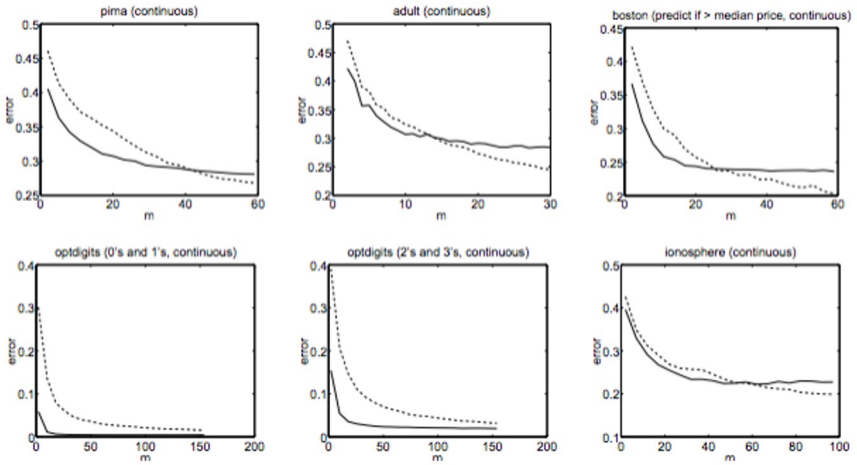
$$y^* = argmax_y P(y|x)$$

- Logistic regression and Naive Bayes are linear models (linear decision boundary)
- They are quite interchangeable.

Naive Bayes vs Logistic regression Generative vs Discriminative modeling

When training data is small, Naive Bayes performs better. When training data is large, Logistic regression performs better.





dashed line - logistic regression
solid line - naive bayes

http://ai.stanford.edu/~ang/papers/nips01-discriminativegenerative.pdf

Fast and good classification using n-grams

- Features: n-grams (bag of phrases)
- Model: logistic regression
- Very competitive results

Model	Yelp'13	Yelp'14	Yelp'15	IMDB

`fastText`, $h = 200$, bigram	46.1	13m38	1m37

Table 5: Prec@1 on the test set for tag prediction on YFCC100M. We also report the training time and test time. Test time is reported for a single thread, while training uses 20 threads for both models.

Bag of Tricks for Efficient Text Classification
https://arxiv.org/pdf/1607.01759.pdf

Naïve Bayes tricks for text classification

- **Domain specific features**
- Count words after “not” as a different word
  - I don’t go there. -> I don’t go_not there_not
- Upweighting: double counting words at important locations
  - Words in titles
  - First sentence of each paragraph
  - Sentences that contain title words

Automatic text categorization using the importance of sentences
https://dl.acm.org/citation.cfm?id=1072331

Different variants of Naive Bayes

- What we described was Multinomial Naive Bayes
  - Takes in word counts (Term frequency - TF)
  - Assumes length independent of class, TF follows Poisson dist
  - Can also take in a binary version of word counts
- There's also Multi-variate Bernoulli Naive Bayes
  - Takes in binary version of word counts
  - Slightly different assumptions, also consider probability when count = 0
- SVM-NB (SVM with NB as features)
- etc.

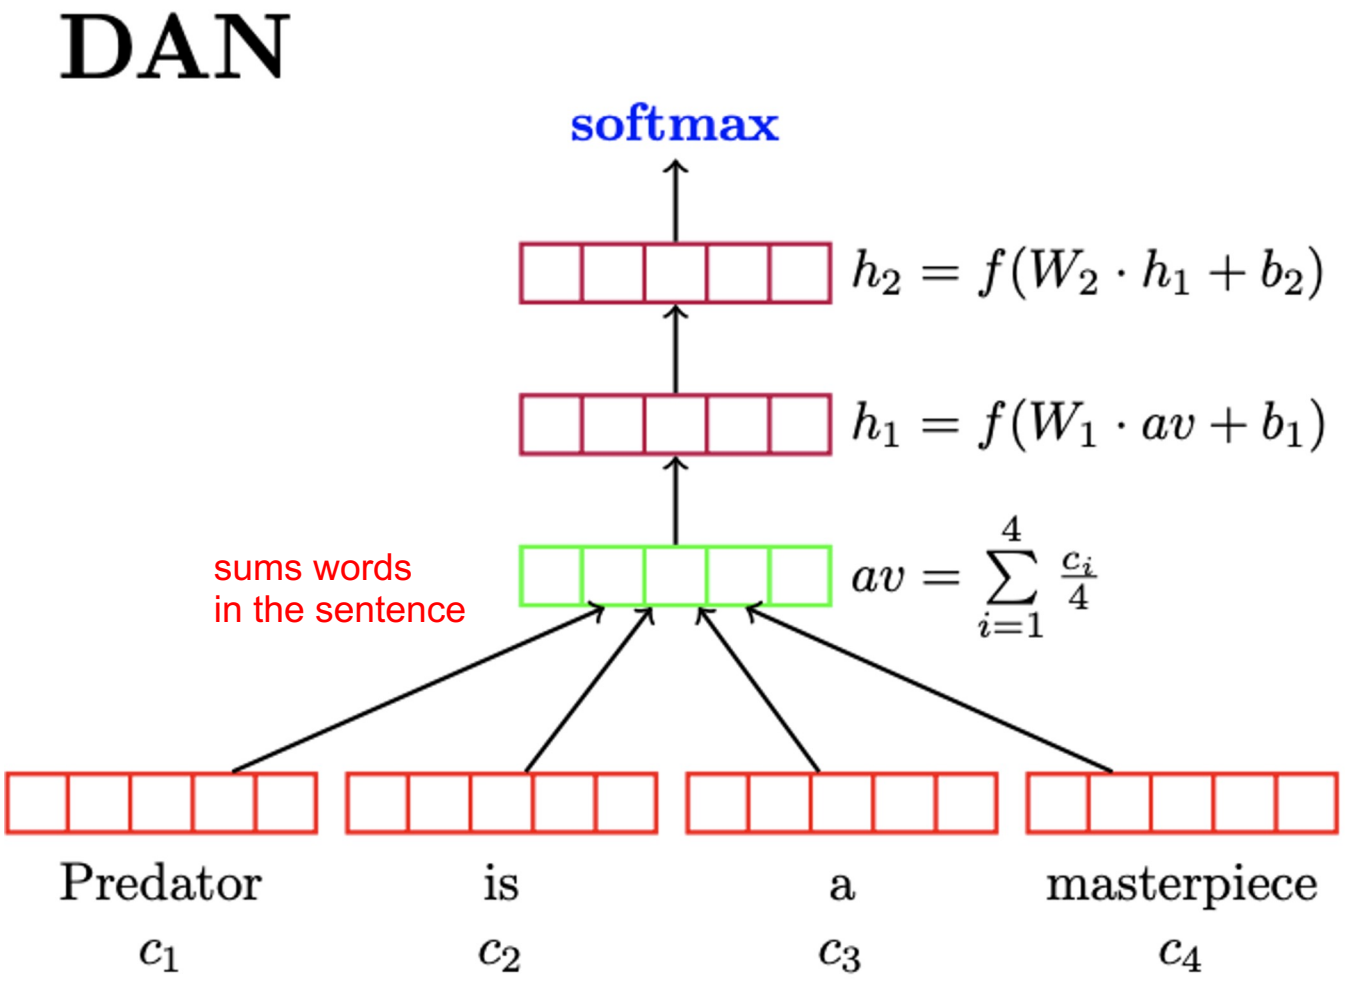
Neural methods

- Sentence/document embedding
  - Deep Averaging Networks
- Universal Sentence Encoder
- Unsupervised pre-training

Deep Averaging Networks (DAN)



https://www.aclweb.org/anthology/P15-1162/ 2015

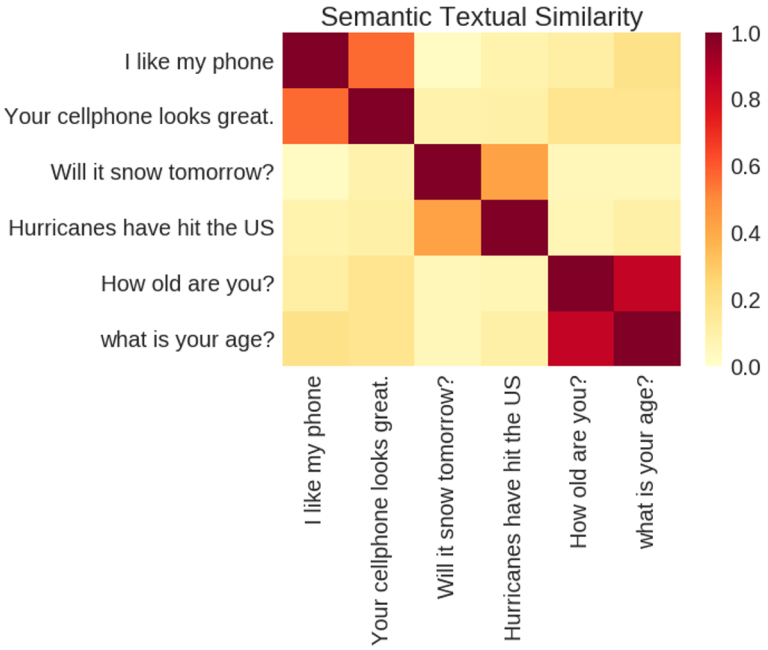
Universal Sentence Encoder (USE)

A model focusing on sentence representation

Use sentencepiece tokenization

Pre-trained then used anywhere

Based on (1) DAN (lite version) or (2) Transformer



Official implementation with pretrained weights

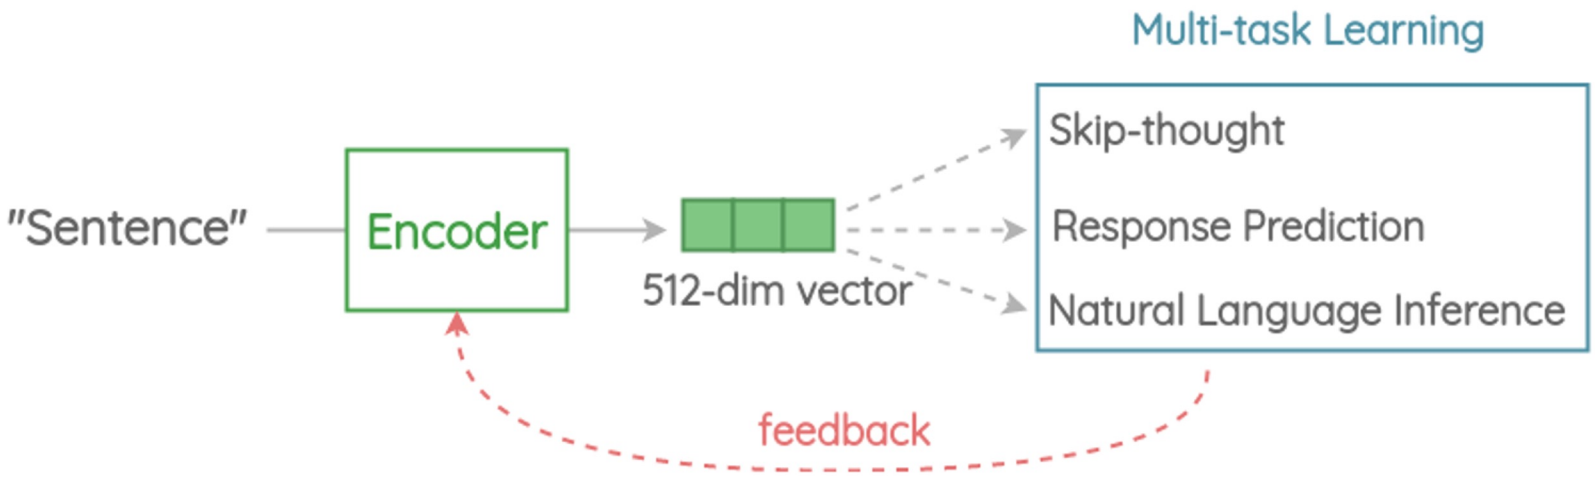
https://tfhub.dev/google/collections/universal-sentence-encoder/1

https://ai.googleblog.com/2018/05/advances-in-semantic-textual-similarity.html

Pretraining USE

Training done using multi-task

1) Skip-thought
2) Response prediction
3) Natural language inference (NLI)

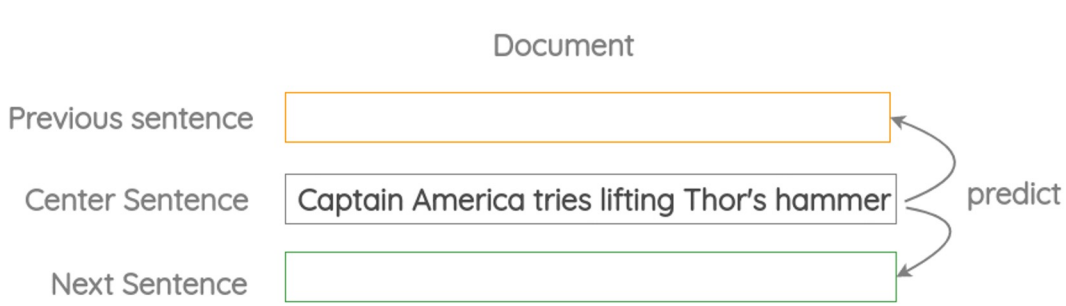


Picture credit: https://amitness.com/2020/06/universal-sentence-encoder/

Skip-thought task

Similar to skip-gram, use the middle to predict context

Unsupervised



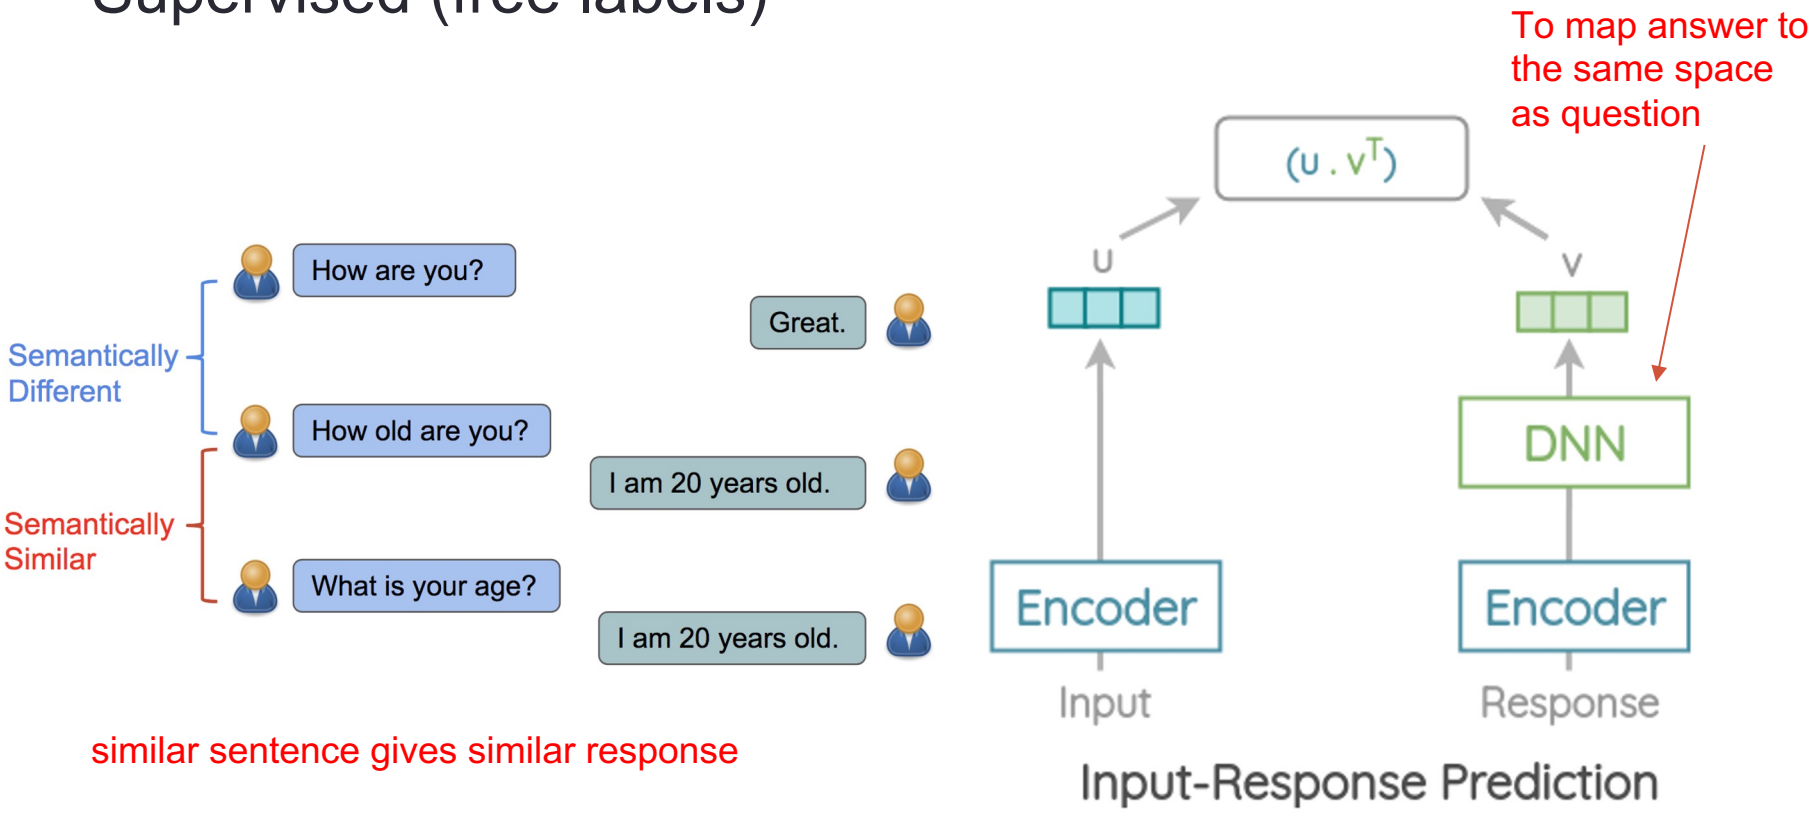
Skip-thought Task Structure

Picture credit: https://amitness.com/2020/06/universal-sentence-encoder/

Response prediction

Match questions and answers in internet forum (scraped)

Supervised (free labels)



similar sentence gives similar response

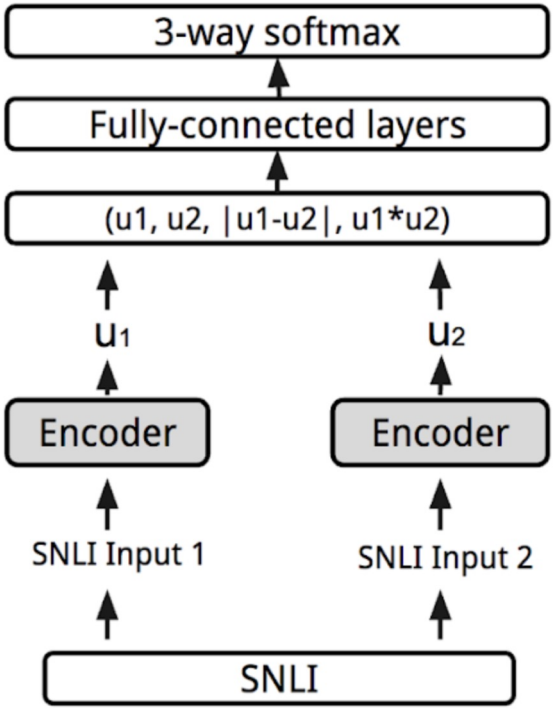
Picture credit: https://amitness.com/2020/06/universal-sentence-encoder/

Natural Language Inference

Predict relationship between sentence

Supervised

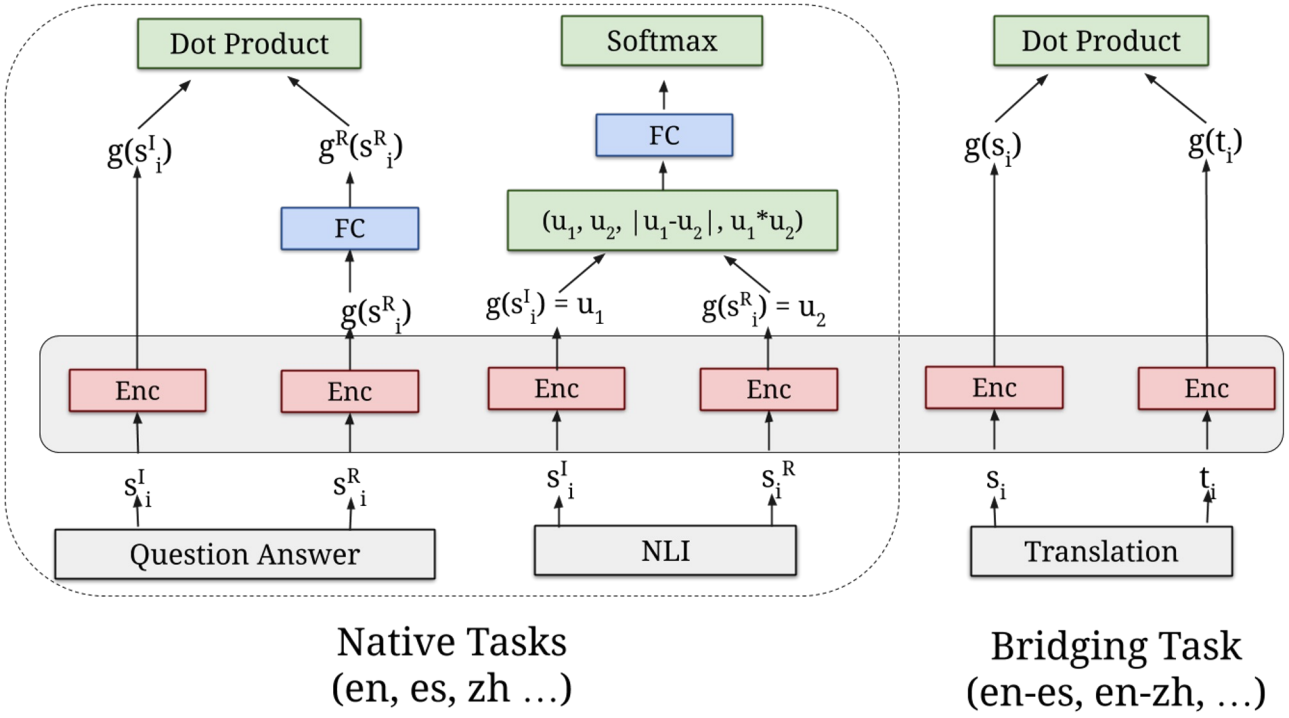
Premise	Hypothesis	Judgement
A soccer game with multiple males playing	Some men are playing a sport	entailment
I love Marvel movies	I hate Marvel movies	contradiction
I love Marvel movies	A ship arrived	neutral



Multilingual USE

Can train to map multiple languages to the same presentation.

Can handle code switching, has Thai!



https://ai.googleblog.com/2019/07/multilingual-universal-sentence-encoder.html

Download-ables

Final words on text classification

Current state-of-the-art are about learning representations

Unsupervised pre-training of text (Word2Vec, BERT, ULMFit, simCSE, ConGen, etc)

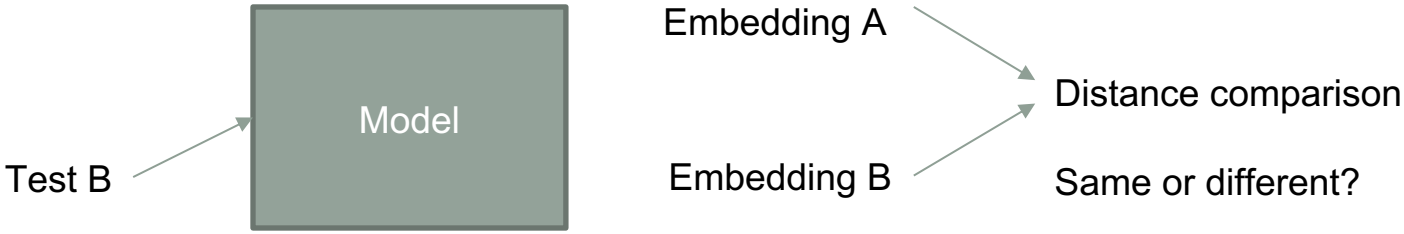
Trend

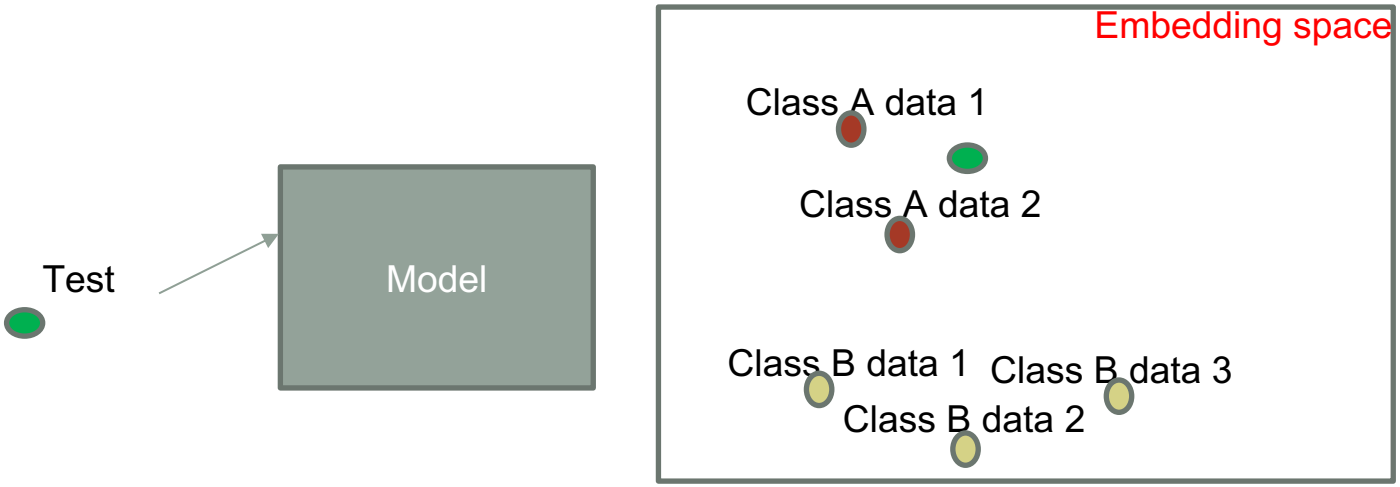
Word representation (non-contextualized)

-> Sentence representation (contextualized)

Zero/few shot classification

- With good sentence/document representations one can use it to perform zero or few shot classification





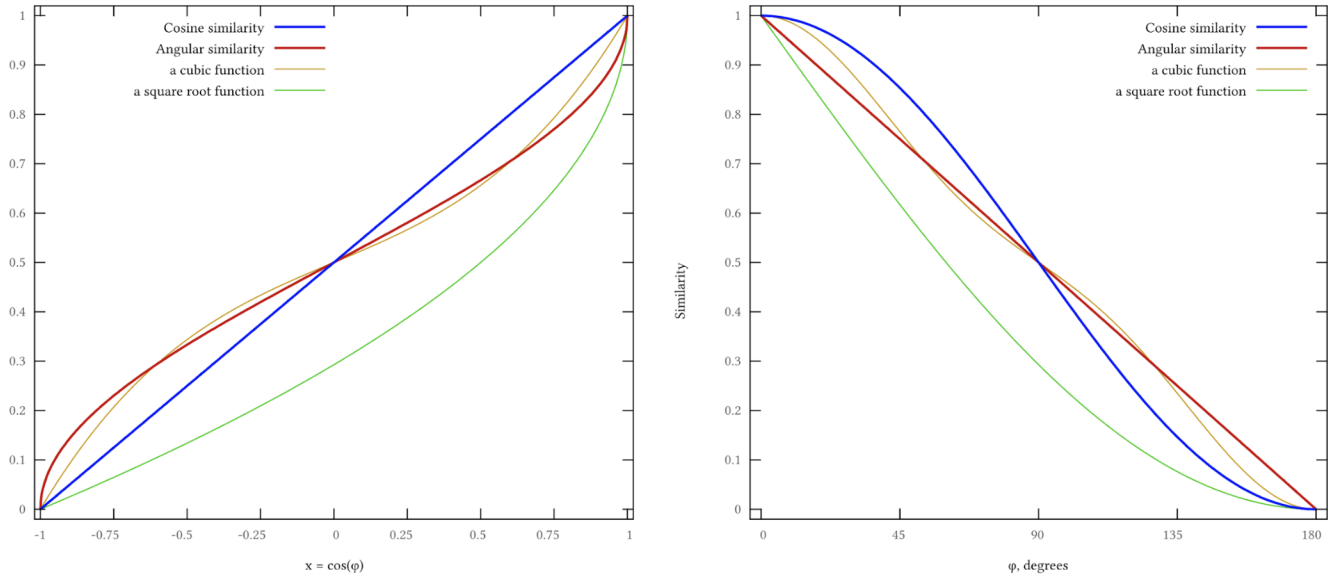
Measuring distance between

In MUSE, they use angular similarity (arccos) rather than cosine similarity

Yields better distance distribution at smaller angles

cosine similarity

$$\text{sim}(\mathbf{u}, \mathbf{v}) = \left(1 - \arccos\left(\frac{\mathbf{u} \cdot \mathbf{v}}{||\mathbf{u}||\ ||\mathbf{v}||}\right)/\pi\right)$$



https://math.stackexchange.com/questions/2874940/cosine-similarity-vs-angular-distance

Benchmarks

prachathai-67k: body_text

We benchmark prachathai-67k by using `body_text` as text features and construct a 12-label multi-label classification. The performance is measured by macro-averaged accuracy and F1 score. Codes can be run to confirm performance at this notebook. We also provide performance metrics by class in the notebook.

model	macro-accuracy	macro-F1
fastText	0.9302	0.5529
LinearSVC	0.513277	0.552801
ULMFit	**0.948737**	**0.744875**
USE	0.856091	0.696172

https://github.com/PyThaiNLP/classification-benchmarks

Benchmarks II

truevoice-intent: destination

(delisted from pythaiNLP due to license concerns)
Chula still has Educational/research license

We benchmark truevoice-intent by using `destination` as target and construct a 7-class multi-class classification. The performance is measured by micro-averaged and macro-averaged accuracy and F1 score. Codes can be run to confirm performance at this notebook. We also provide performance metrics by class in the notebook.

model	macro-accuracy	micro-accuracy	macro-F1	micro-F1
LinearSVC	**0.957806**	**0.95747712**	**0.869411**	**0.85116993**
ULMFit	0.955066	0.84273111	0.852149	0.84273111
BERT	0.8921	0.85	0.87	0.85
USE	0.943559	0.94355855	0.787686	0.802455

https://github.com/PyThaiNLP/classification-benchmarks

Benchmarks III

wongnai-corpus

Performance of wongnai-corpus is based on the test set of Wongnai Challenge: Review Rating Prediction. Codes can be run to confirm performance at this notebook.

Model	Public Micro-F1	Private Micro-F1
ULMFit Knight	**0.61109**	**0.62580**

fastText	0.5145	0.5109
LinearSVC	0.5022	0.4976
Kaggle Score	0.59139	0.58139
BERT	0.56612	0.57057
USE	0.42688	0.41031

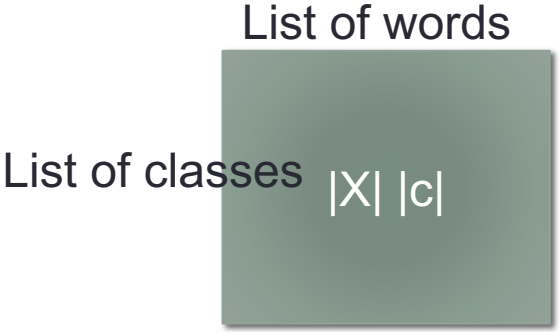
WangchanBERTA ~0.63

Relationship to language modeling

- P(x|c)

x_1 is a feature that looks at the first word

- $P(x = \text{ยอด} \mid c=5) = \frac{\text{count}(x = \text{ยอด}\ ,\ c = 5)}{\text{count}(\ c = 5)}$
- P(c)
- $P(c = 5) = \frac{\text{count}\ (c = 5)}{\text{count}\ (\text{all reviews})}$



This looks like… n-grams, but instead of conditioning on the past, we condition on the topic –
bag of words model for topic modeling (unigram with topic)

Language modeling view

- Which class is this review
- P(w|c)

อร่อย แต่ ไม่ ถูก

Class= 1	
อร่อย	0.01
แต่	0.4
ไม่	0.4
ถูก	0.03
…	

Class= 5	
อร่อย	0.4
แต่	0.05
ไม่	0.25
ถูก	0.15
…	

P(s|c =1) = 0.01*0.4*0.4*0.03 = 0.000048
P(s|c = 5) = 0.4*0.05*0.25*0.15 = 0.00075

Topic modeling

- Sometimes you want to model the topic of a document

Class=
บรรยากาศ

อร่อย 0.01
แต่ 0.4
ไม่ 0.4
ถูก 0.03
…

Class=
อาหาร

อร่อย 0.4
แต่ 0.05
ไม่ 0.25
ถูก 0.15
…

อาหารที่นี่ไม่ค่อยอร่อย แต่ขนมใช้ได้เลย ถ้าวางอาจจะกลับมากินอีก แนะนำให้สั่งเค้กใบเตย

ด้านบรรยากาศ มีเสียงก่อสร้างมาจากตึกข้างๆ แต่นอกนั้นตกแต่งโอเค แต่ยังขาดอะไรไปหลายๆอย่าง

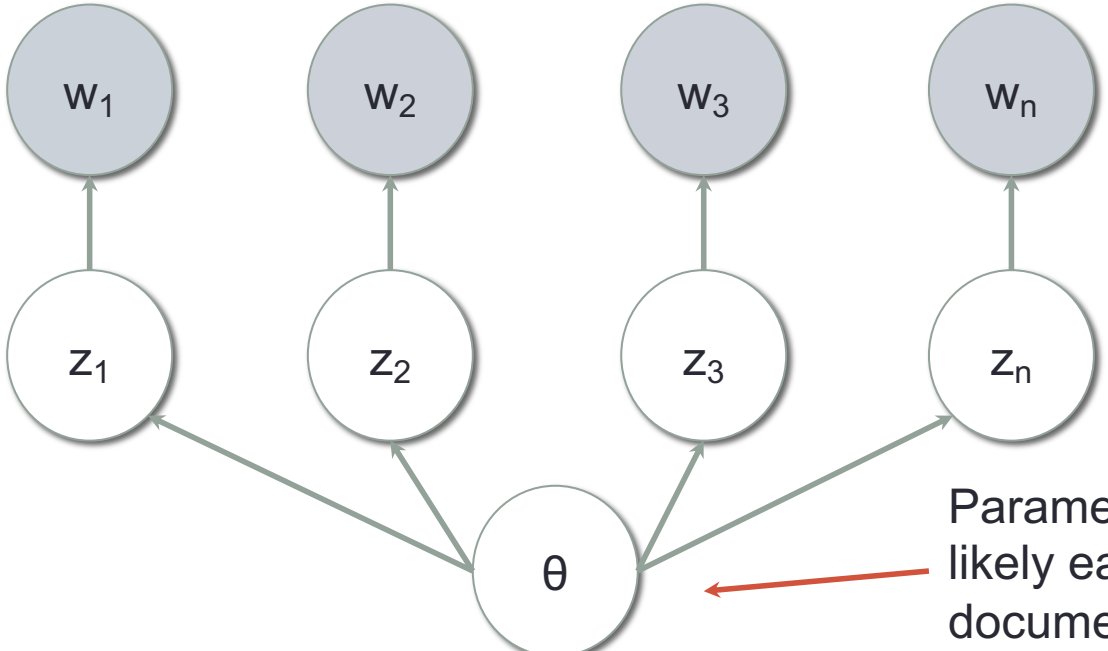
$P(s|c=\text{บรรยากาศ}) = ?$
$P(s|c=\text{อาหาร}) = ?$

Naïve Bayes Topic modeling issues

- Most document have multiple topics (multi-label).
  - Our model assumes 1 document 1 topic.
- Solution: Let a document be a mixture of topics (language model interpolation). Each word has its own topic, z.
  - P(w) = P(w is topic A) P(w | topicA) + P(w is topic B) P(w | topicB)
  - P(w is topic A) + P(w is topic B) = 1

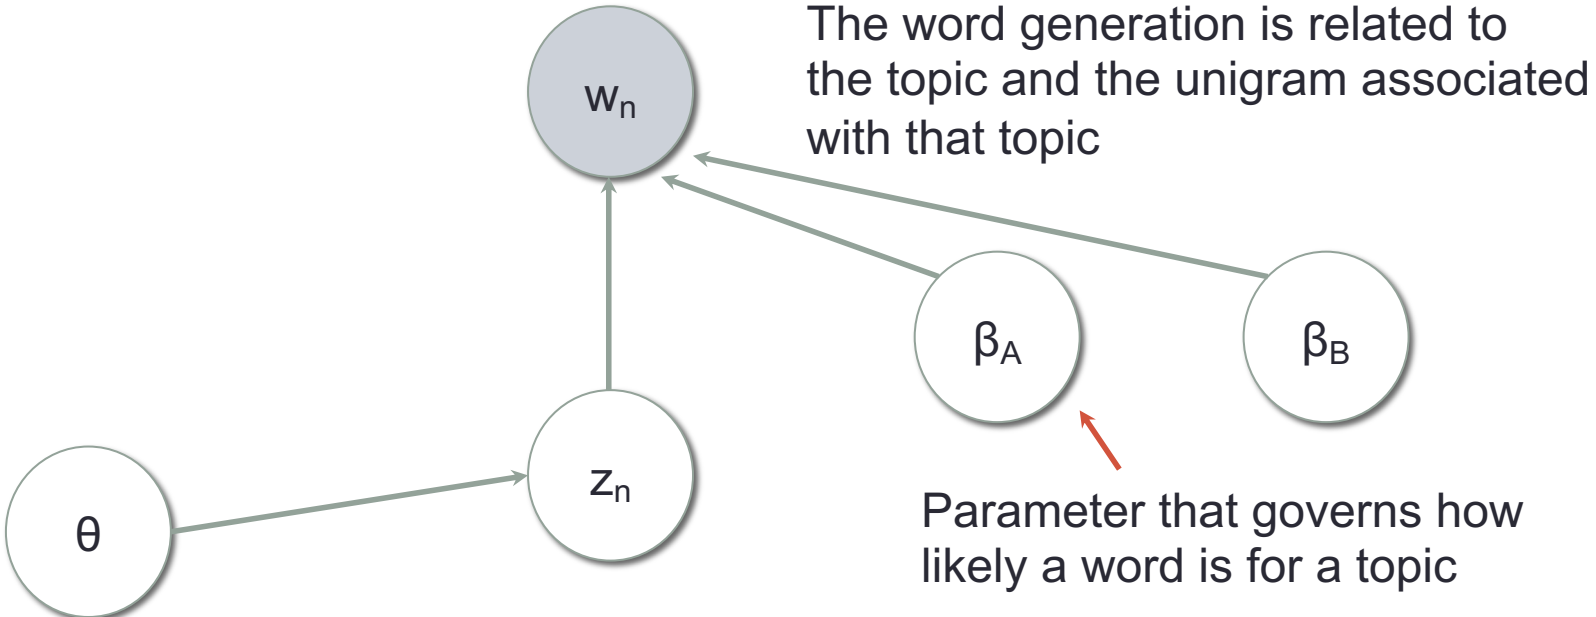
Naïve Bayes Topic modeling issues

- Most document have multiple topics. Our model assumes 1 document 1 topic.
  - Let a document be a mixture of topics (language model interpolation). Each word has its own topic, z.
    - P(w) = P(z = A) P(w | z = A) + P(z = B) P(w | z = B)
    - P(z = A) + P(z = B) = 1, θ = P(z = A)



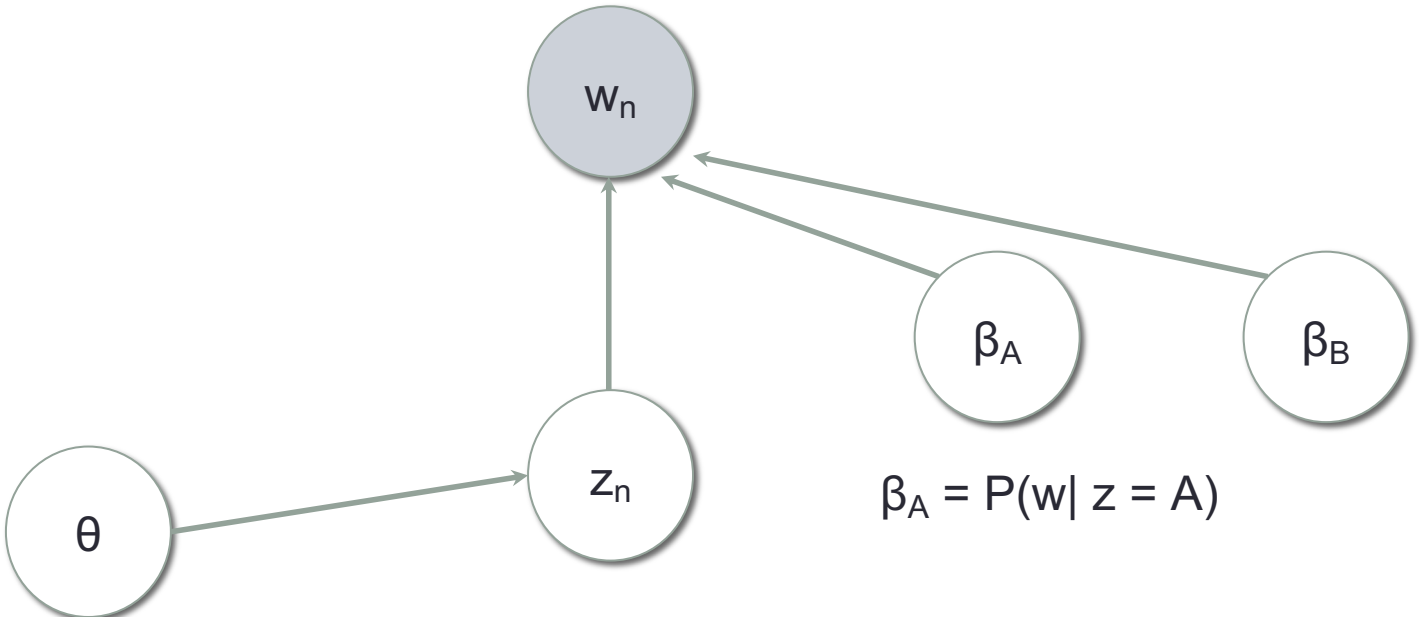
Topic modeling

- Most document have multiple topics. Our model assumes 1 document 1 topic.
  - Let a document be a mixture of topics (language model interpolation). Each word has its own topic, z.
    - P(w) = P(z = A) P(w | z = A) + P(z = B) P(w | z = B)
    - P(z = A) + P(z = B) = 1, $\theta = P(z = A)$ $\beta_A = P(w| z = A)$



Graphical model and generation

- You can generate a sample from a graphical model by following the arrows

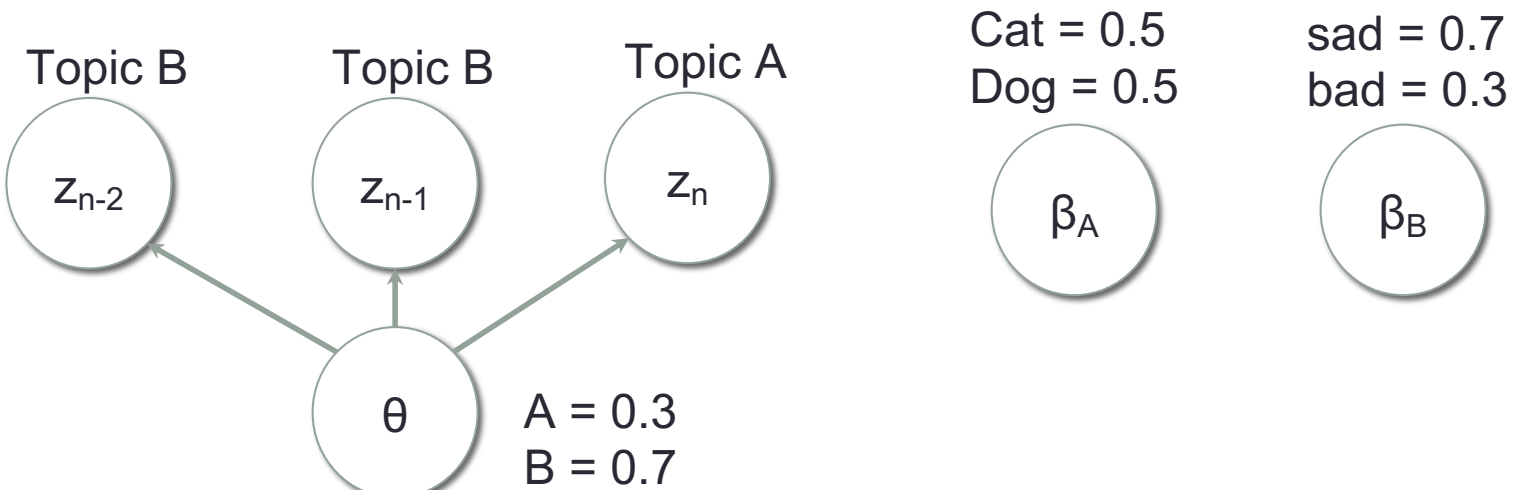


Graphical model and generation

- Given θ, β_A, β_B

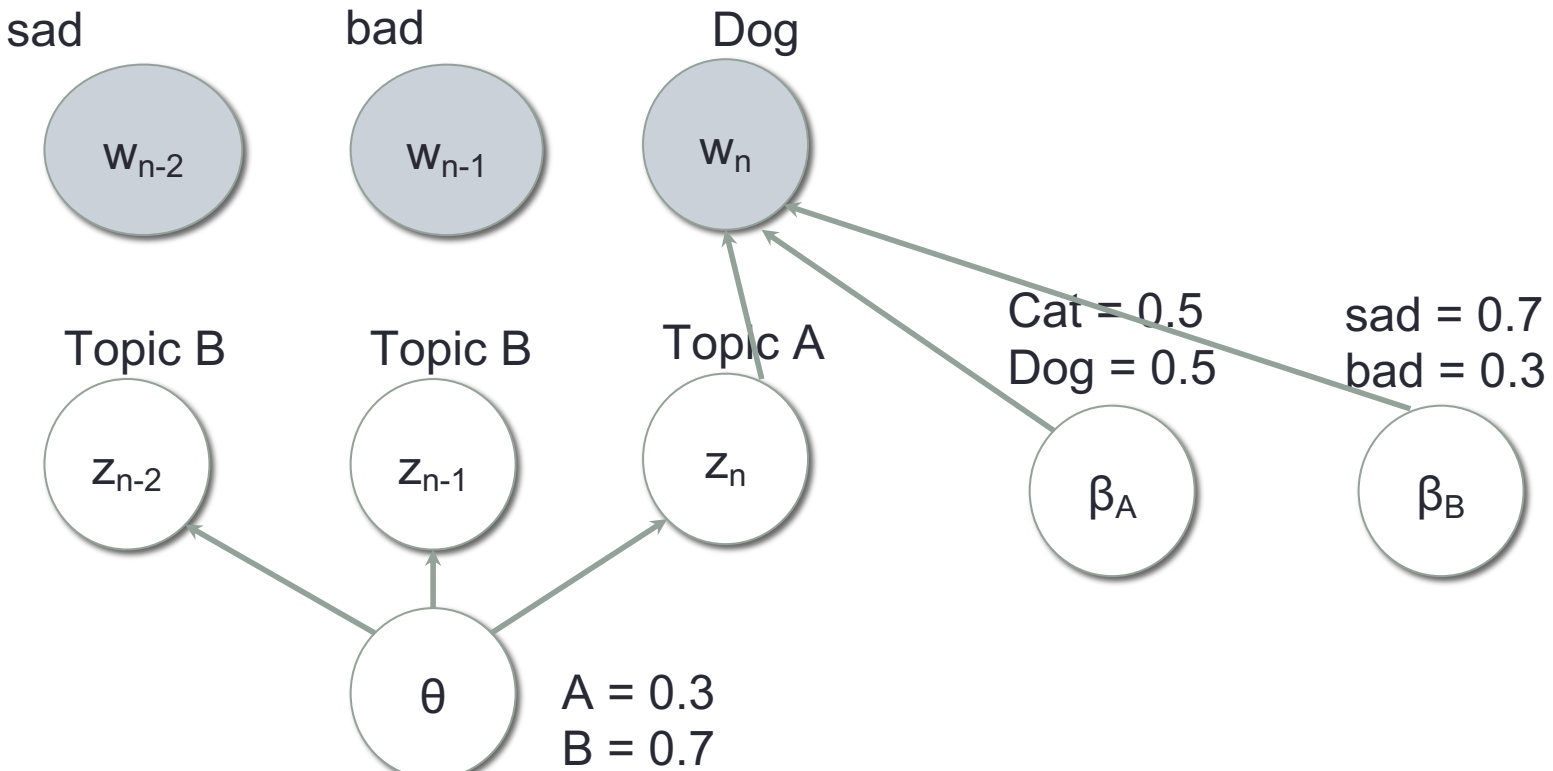
Graphical model and generation

- Given θ, β_A, β_B
- Generate (randomly create) z from θ



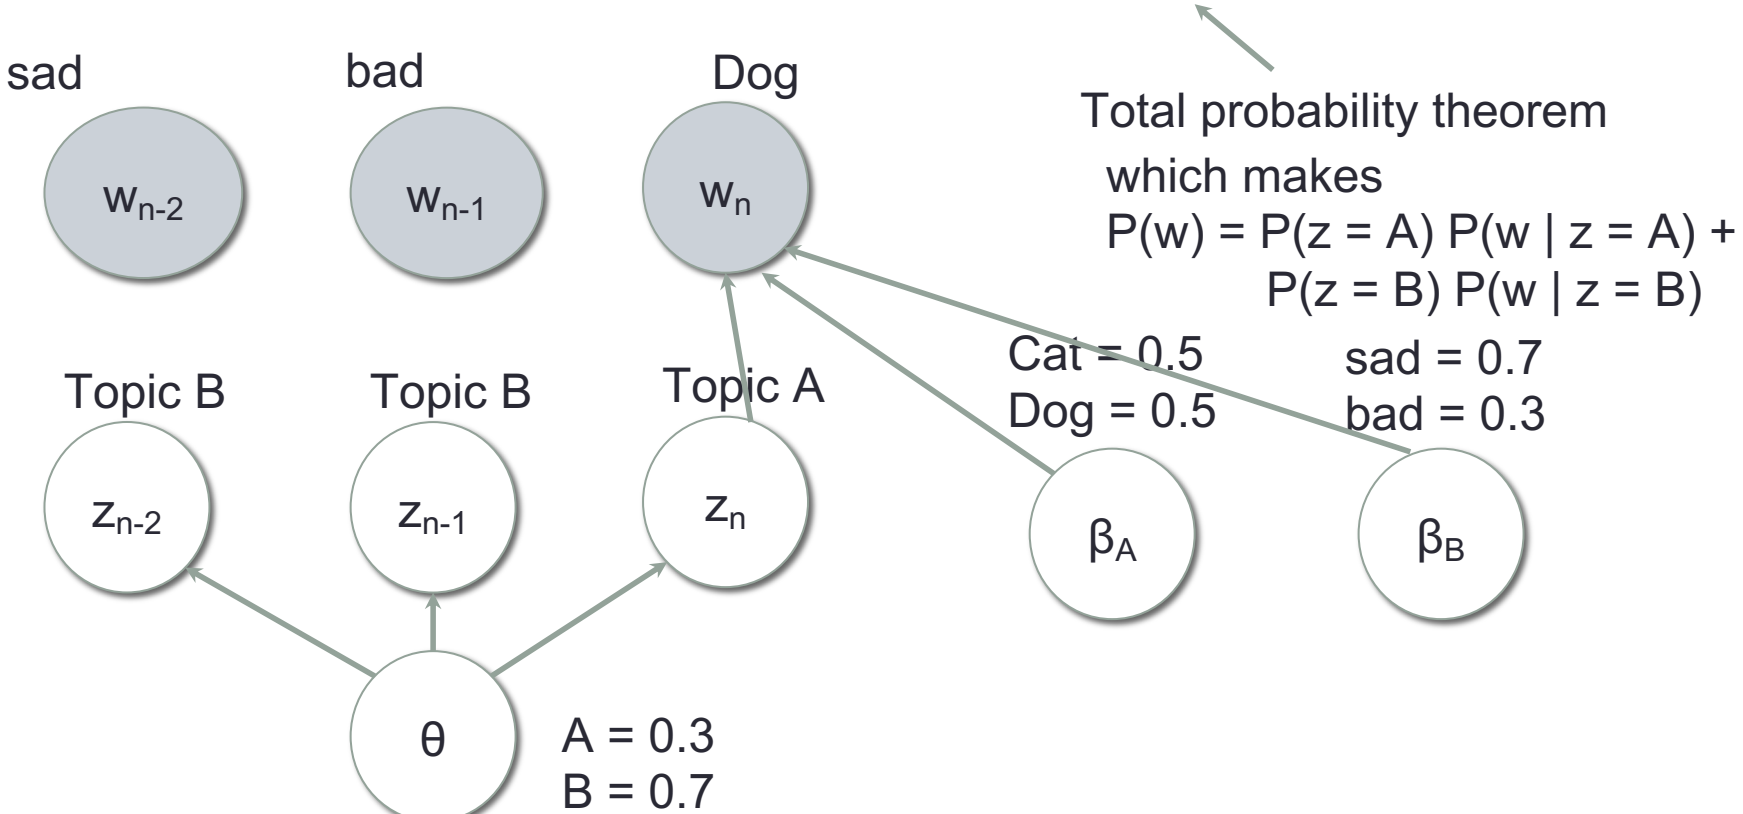
Graphical model and generation

- Given θ, β_A, β_B
- Generate (randomly create) z from θ
- Generate w_n from z_n β_A, β_B



Graphical model and generation

How likely a sentence is likely to be generated follows this generation process
P(sad,bad,Dog,B,B,A) = P(B)P(B)P(A)P(sad|B)P(bad|B)P(Dog|A)
Note
P(sad,bad,Dog) = P(sad,bad,Dog,A,A,A) + P(sad,bad,Dog,A,A,B)
P(sad,bad,Dog,A,B,A) + P(sad,bad,Dog,A,B,B) +...



Graphical models and plate notation

- Sometimes you have too many relationships.

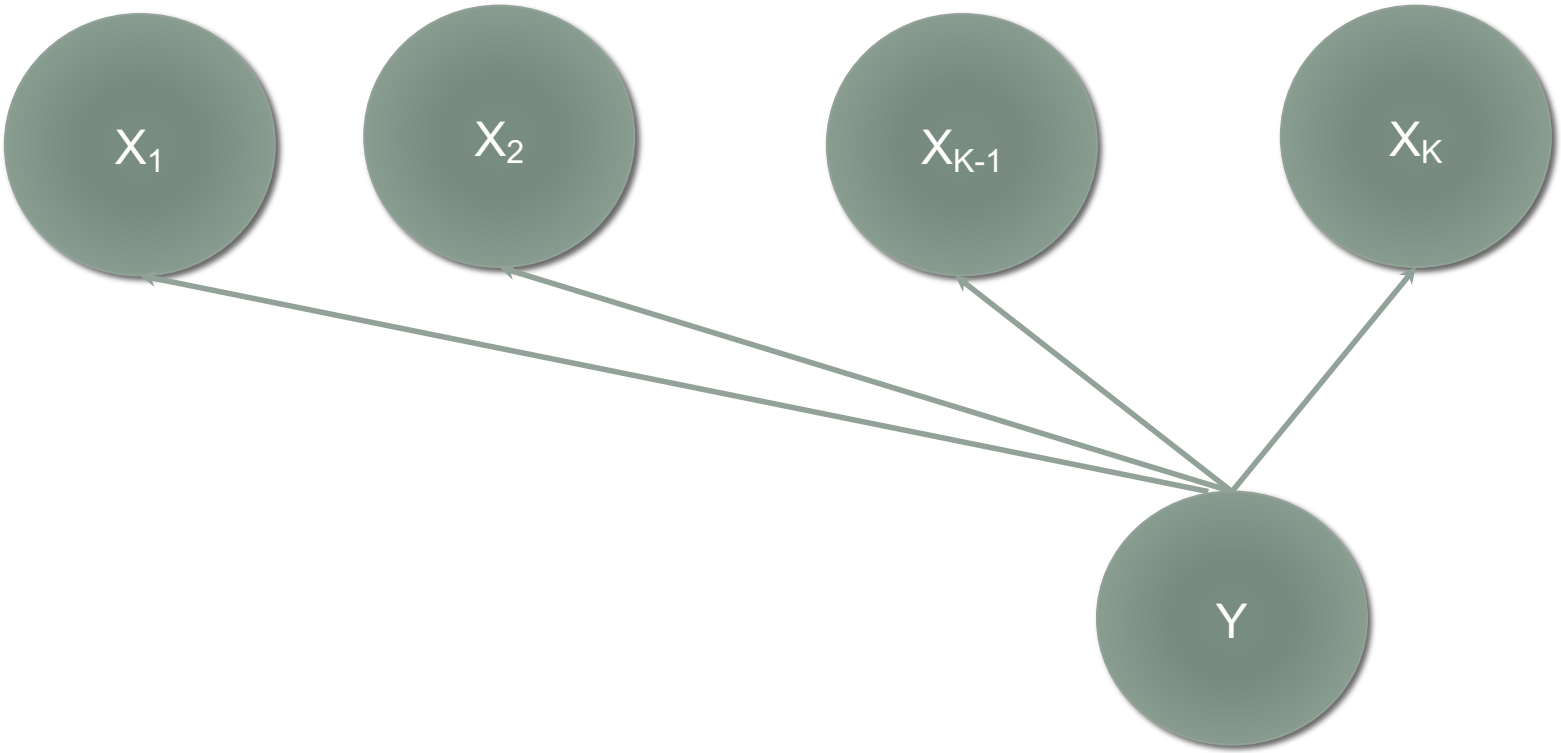


Plate notation

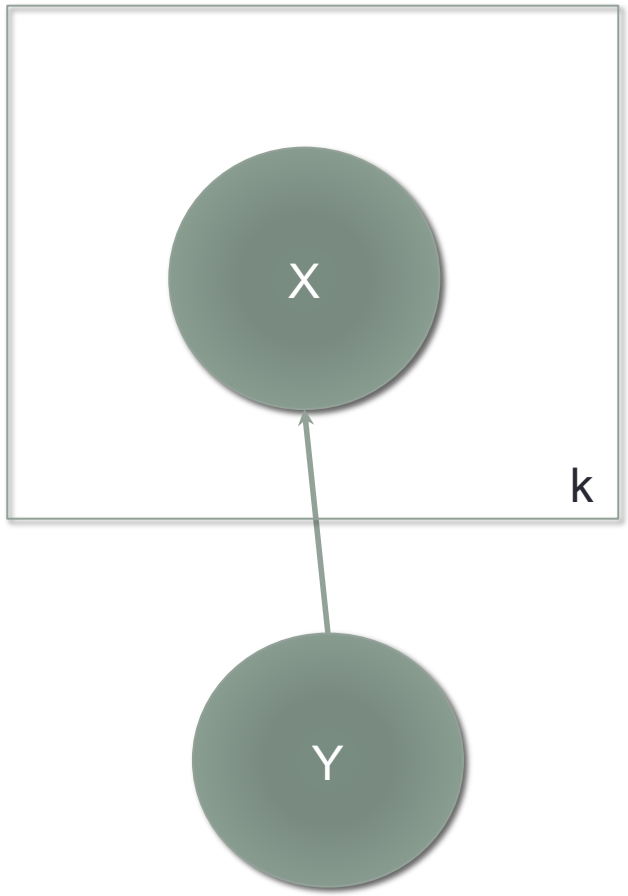
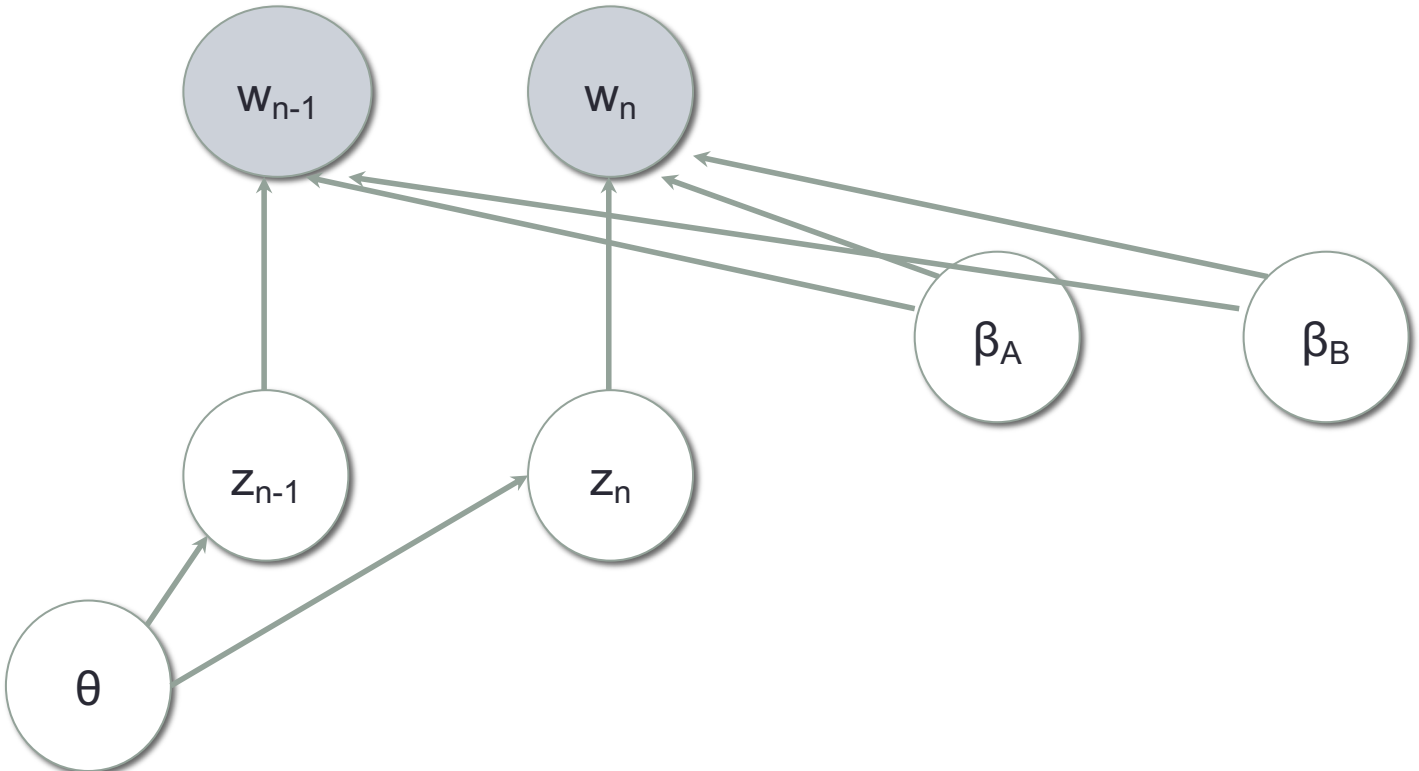
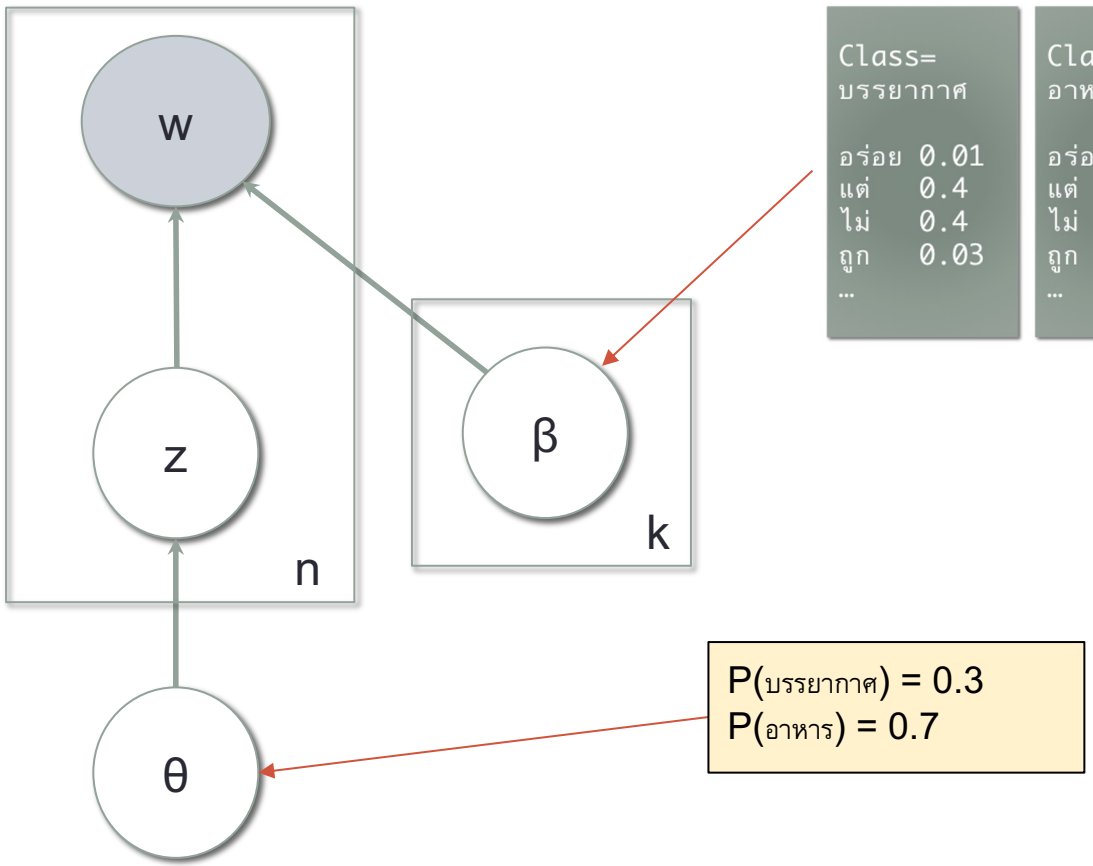
- Summarize by using a square box with number



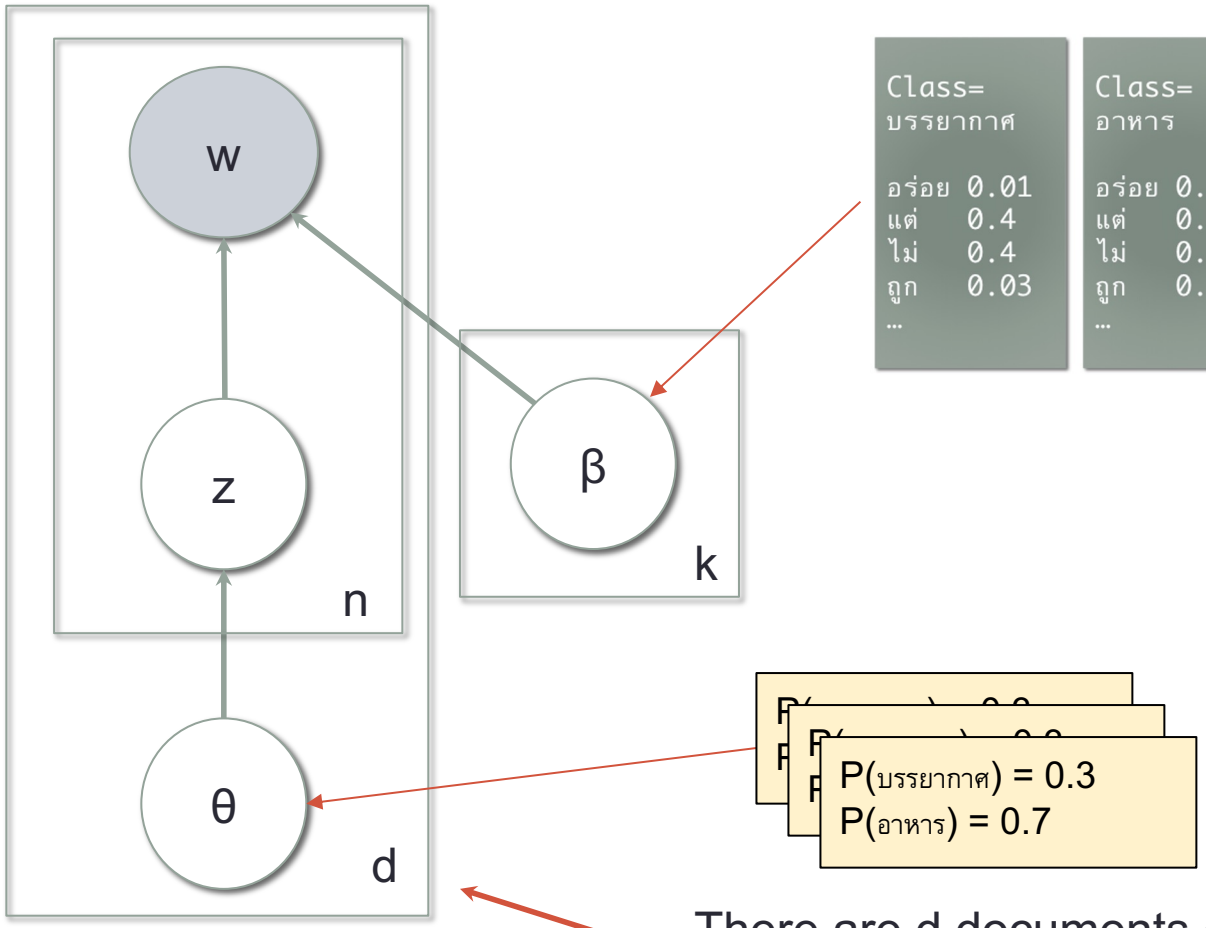
Topic modeling with plate notation



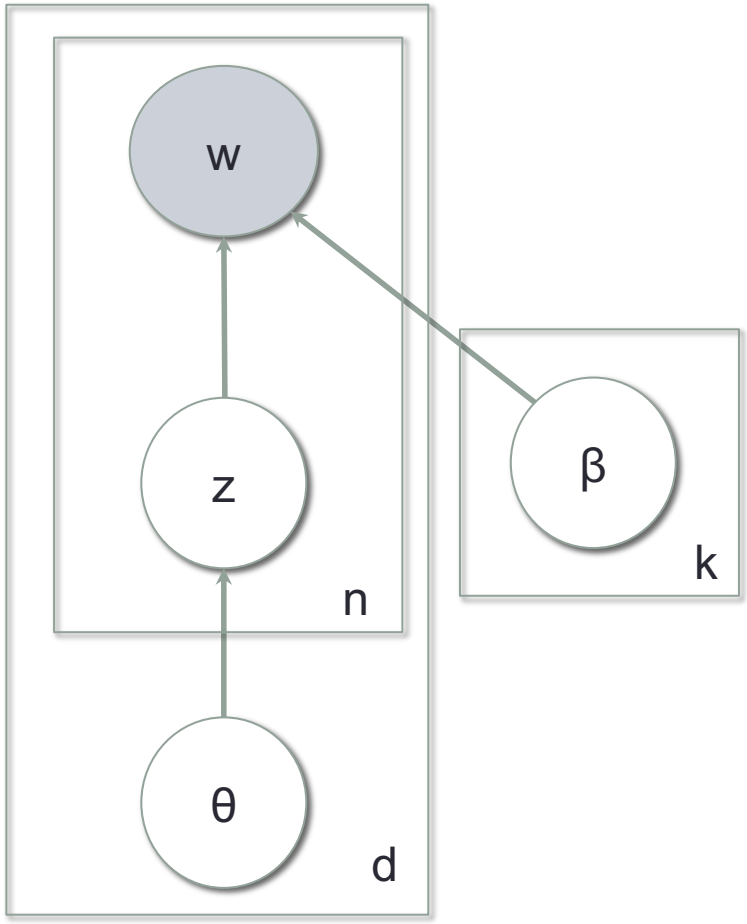
Topic modeling with plate notation



Topic modeling with plate notation

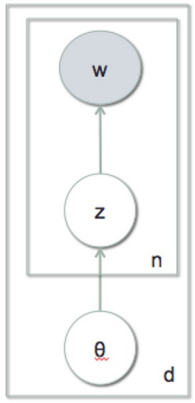


Topic modeling with plate notation



Called pLSA
probabilistic Latent Semantic Analysis

Note: if you look at other textbooks, you will see a slightly different picture



Learning topic latent model parameters

- How to find θ and β?
  - “Cat, Dog, sad”, “Cat, Cat, Cat, bad”, “Dog, Dog, bad, Dog, sad”
- If we know, the latent topic z for each word we can use the counts
  - “Cat_A, Dog_A, sad_B”
- $P(Cat|A) = \frac{count(Cat\_A)}{count(A)}$
- $P_1(A) = \frac{count(A)}{count(\text{all words in document 1})}$
- But we don’t know the topic z for each word

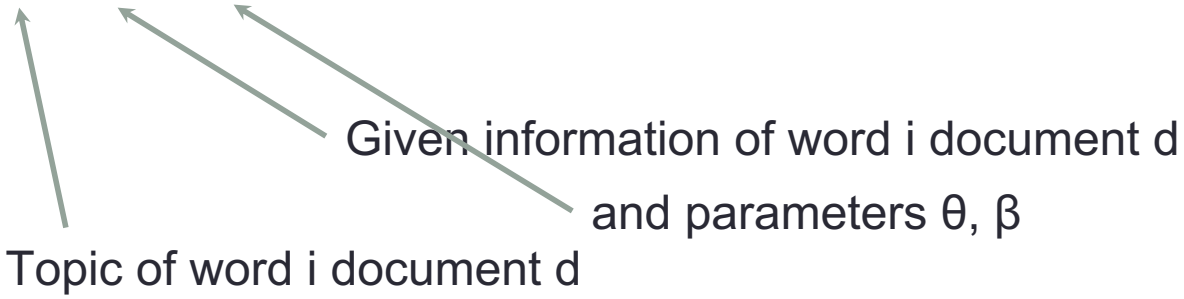
dont worry about it if you don't
understand

Expectation maximization (EM)

- A method to iteratively maximize the likelihood of a model on training data
  - Expectation step (E step) – guess latent variables from model parameters (get soft counts)
  - Maximization step (M step) – re-estimate model parameters from latent variables (counts)

E-step

- Find an estimate for the latent variable given parameters θ, β
- $p(z_{di} \mid w_{di}, \theta, \beta)$



E-step

- Find an estimate for the latent variable given parameters θ, β

$$p(z_{di}|w_{di},\theta,\beta) = \frac{p(z_{di},w_{di},\theta,\beta)}{\sum_{z'=1}^{k} p(z'_{di},w_{di},\theta,\beta)}$$

p(w, θ, β)

E-step

- Find an estimate for the latent variable given parameters θ, β

$$p(z_{di}|w_{di},\theta,\beta) = \frac{p(z_{di},w_{di},\theta,\beta)}{\sum_{z'=1}^{k} p(z'_{di},w_{di},\theta,\beta)}$$

$$= \frac{\theta_{z|d}\beta_{w|z}}{\sum_{z'=1}^{k} \theta_{z'|d}\beta_{w|z'}}$$

Index di for z and w dropped for clarity

E-step

- Find an estimate for the latent variable given parameters θ, β

$$p(z_{di}|w_{di},\theta,\beta) = \frac{p(z_{di},w_{di},\theta,\beta)}{\sum_{z'=1}^{k} p(z'_{di},w_{di},\theta,\beta)}$$

$$= \frac{\theta_{z|d}\beta_{w|z}}{\sum_{z'=1}^{k} \theta_{z'|d}\beta_{w|z'}}$$

P(Word is from topic A| word is cat from document 1)
Probability that the word is from each topic. Use as counts

M-Step

- Instead of real counts use $P(z_{di})$ as the topic label

- $P(Cat|A) = \frac{count(Cat\_A)}{count(A)}$

Sum $P(z_{di} = A)$ for all w = cat, all docs

Sum $P(z_{di} = A)$ for all words, all docs

- $P_1(A) = \frac{count(A)}{count(\text{all words in document 1})}$

Sum $P(z_{1i} = A)$ for all words doc 1

Expectation maximization (EM)

- Initialize θ, β
- Expectation step (E step) – guess latent variables from model parameters (get soft counts)
- Maximization step (M step) – re-estimate model parameters from latent variables (counts)
- Repeat E and M step until satisfied (Likelihood of the whole training set using the model does not change much)

- For more info on EM see pattern recognition lecture 4
  - https://www.youtube.com/watch?v=Q-aIhSRDF0o

pLSA

- pLSA automatically clusters words into topic unigrams
  - Requires user to specify number of topics
- Automatically learn document representation based on the learned topics
  - DocA = [0.7 0.3] DocB = [0.2 0.8] DocC = [0.5 0.5]
- Overfits easily to data outside of the training set
  - Nothing that ties all document together
  - A document from a document collection should be have topic distributions that are similar
- Solution: LDA (Latent Dirichlet Allocation)

pLSA

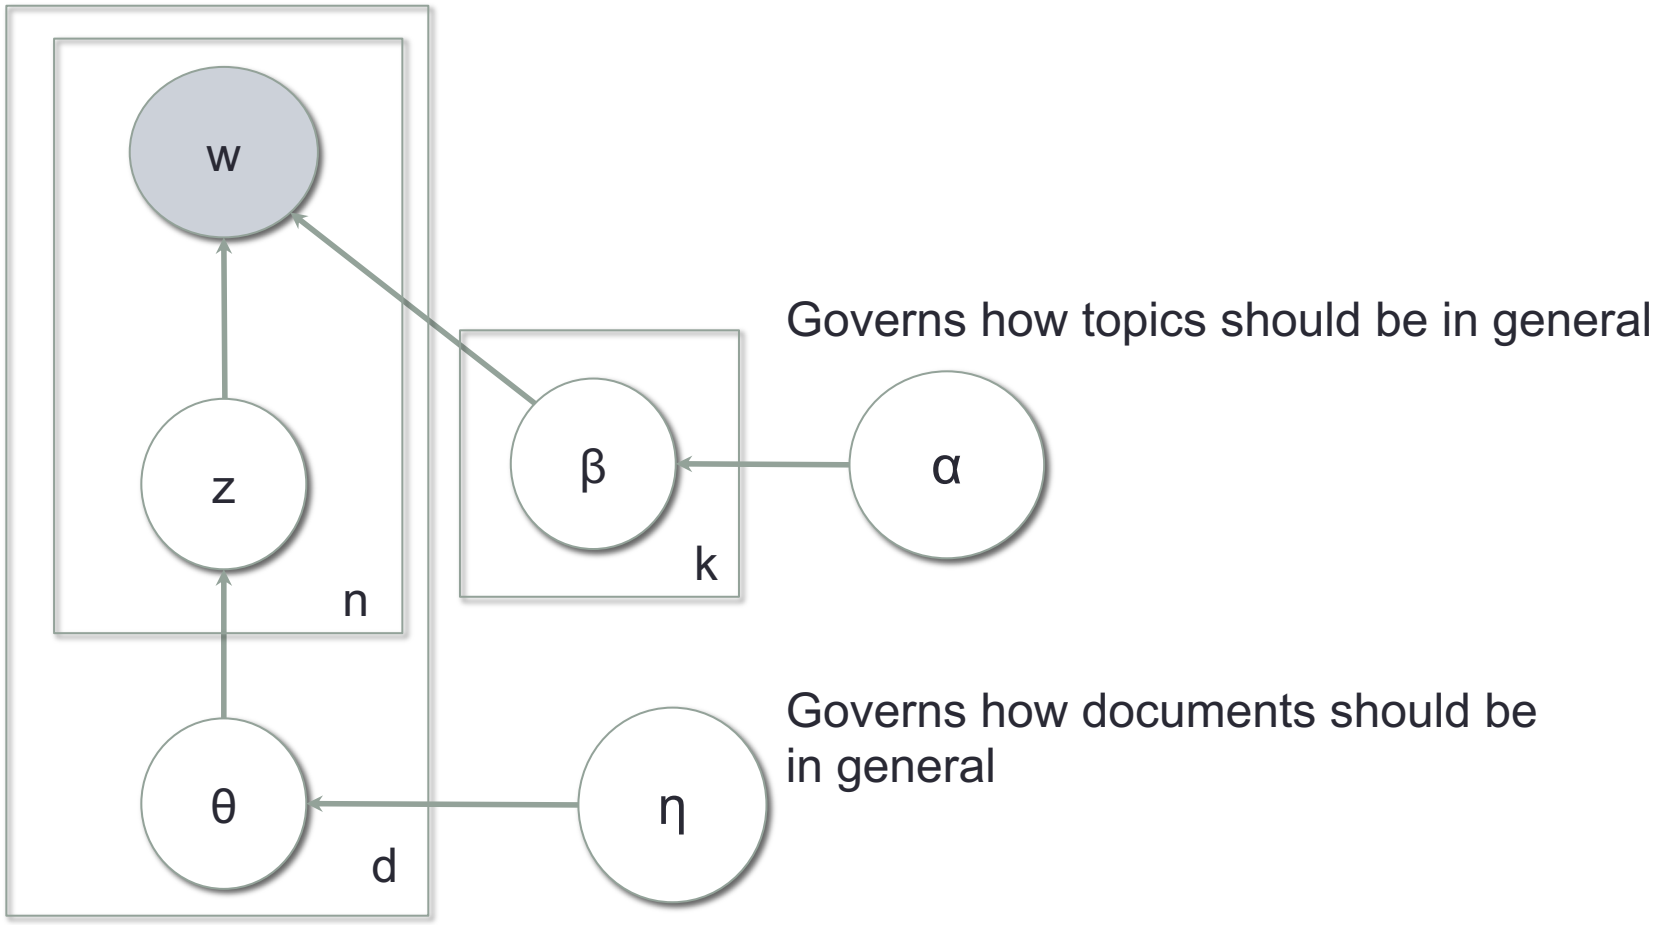
LDA



w
z
n
θ
d
β
k
α
η
Governs how topics should be in general
Governs how documents should be in general

α and η

- α is a Dirichlet distribution
- Or a distribution of distributions…

- Example: rolling a die
- P(x=1) = 0.3, P(x=2) = 0.1,…
- This is a distribution. (Multinomial distribution)
- But what if I have a bag of dices, each with different distributions.
- α tells me the probability of what kind of die I will get

Dirichlet distribution

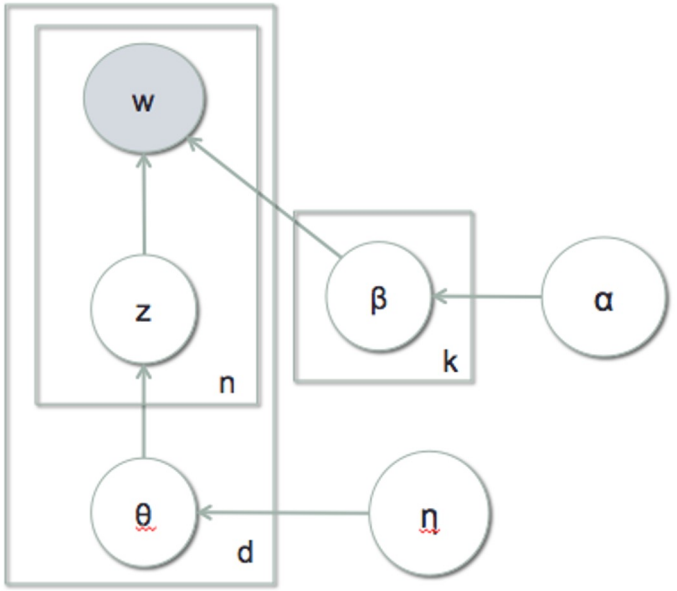
- pdf

Parameters giving preference to each side of die/topic

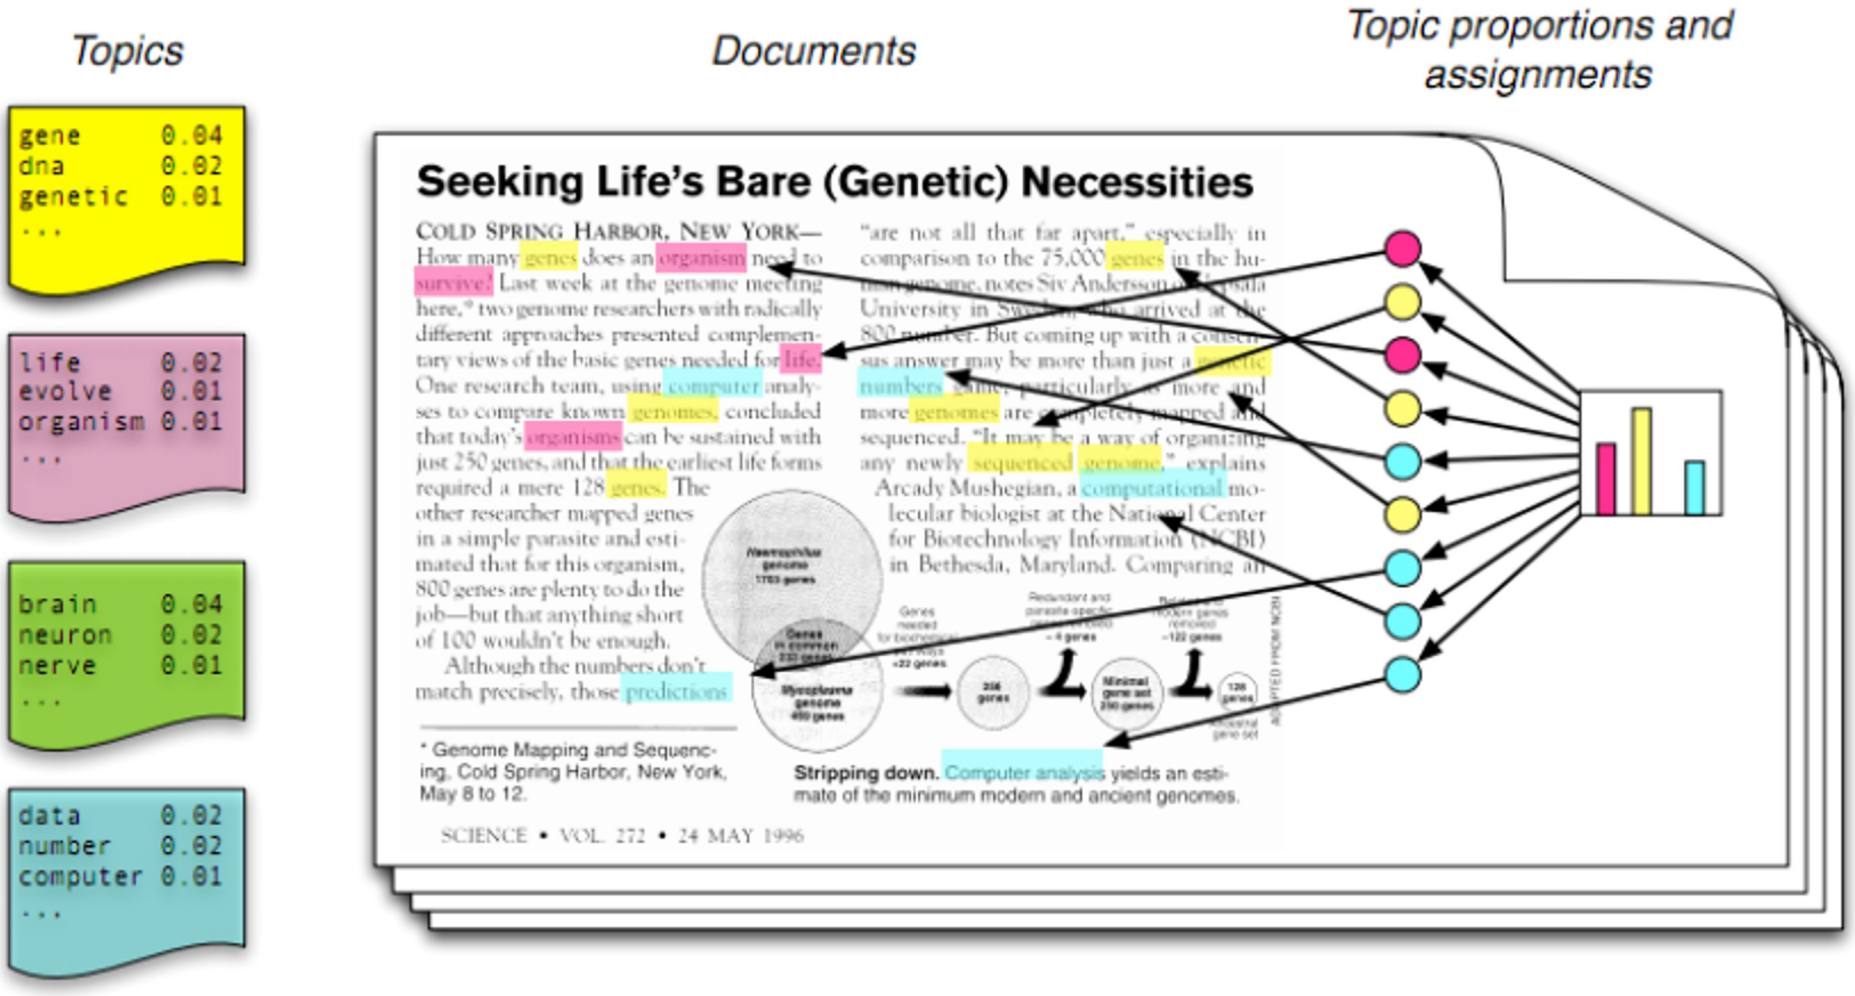
$$f(x_1, \ldots, x_K; \alpha_1, \ldots, \alpha_K) = \frac{1}{\mathrm{B}(\boldsymbol{\alpha})} \prod_{i=1}^{K} x_i^{\alpha_i - 1}$$

Probability of each side of die, probability of each topic

Generative process



- For each topic k ∈ {1,...,K}:
  - Draw word distributions $\beta_k \sim \text{Dir}(\eta)$
- For each document d ∈ {1,...,D}:
  - Draw topic proportions $\theta_d \sim \text{Dir}(\alpha)$
  - For each word in a document n ∈ {1,...,N}:
    - Draw a topic index $z_{dn} \sim \text{Mult}(\theta)$
    - Generate word from chosen topic
      - $w_{dn} \sim \text{Mult}(\beta_{zdn})$



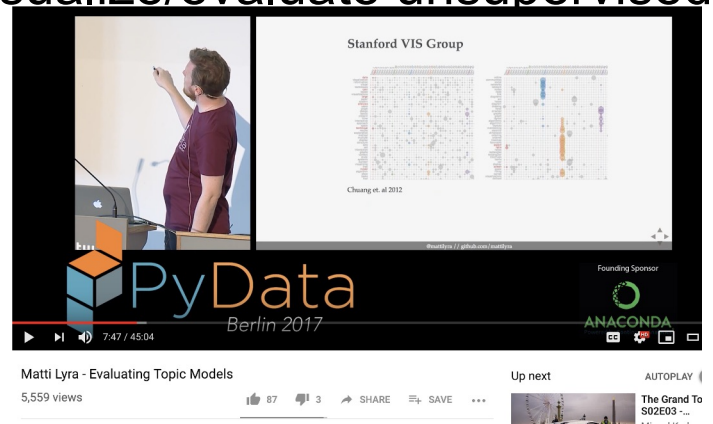
Introduction to Probabilistic Topic Models, Blei 2011
http://menome.com/wp/wp-content/uploads/2014/12/Blei2011.pdf

Parameter learning

- How do we learn these parameters and latent variables?
  - Gibbs sampling (used in MALLET https://radimrehurek.com/gensim_3.8.3/models/wrappers/ldamallet.html)
  - Variational method (used in genism https://radimrehurek.com/gensim/models/ldamodel.html)
  - Gibbs version slower but seems to give better results anectodally
- Totally beyond the scope of this class

LDA

- Automatically learns topics, and the word distribution of each topic
  - Just give a bunch of documents!
  - Each document is given a mixture of topics
    - Dirichlet prior prefers sparse topics – each document only have probability in few topics – easy for interpretability
- Requires user to pick number of topic
- Requires user to make sense of the learned topics
  - For more information on how to help visualize/evaluate unsupervised topic models
    - https://youtu.be/UkmlljRIG_M



Example usage

- Lots of lectures. Can we discover the topics? Can we classify the lectures? No topic labels given

Top 10 high probability nouns in word probabilities of Topics 3 ($\theta_{k=3}$), 15 ($\theta_{k=15}$), and 26 ($\theta_{k=26}$).

Topic 3 (~ classical mechanics)	Topic 15 (~astronomy)	Topic 26 (~ (time) unit)

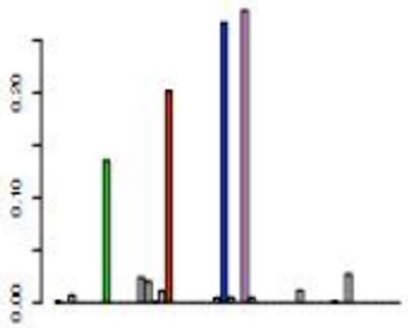
Expected topic proportions



Abstract with the most likely topic assignments

Statistical approaches help in the determination of significant configurations in protein and nucleic acid sequence data. Three recent statistical methods are discussed: (i) score-based sequence analysis that provides a means for characterizing anomalies in local sequence text and for evaluating sequence comparisons; (ii) quantile distributions of amino acid usage that reveal general compositional biases in proteins and evolutionary relations; and (iii) *r*-scan statistics that can be applied to the analysis of spacings of sequence markers.

Article information

Altmetric 17

Abstract

Words are part of almost every marketplace interaction. Online reviews, customer service calls, press releases, marketing communications, and other interactions create a wealth of textual data. But how can marketers best use such data? This article provides an overview of automated textual analysis and details how it can be used to generate marketing insights. The authors discuss how text reflects qualities of the text producer (and the context in which the text was produced) and impacts the audience or text recipient. Next, they discuss how text can be a powerful tool both for prediction and for understanding (i.e., insights). Then, the authors overview methodologies and metrics used in text analysis, providing a set of guidelines and procedures. Finally, they further highlight some common metrics and challenges and discuss how researchers can address issues of internal and external validity. They conclude with a discussion of potential areas for future work. Along the way, the authors note how textual analysis can unite the tribes of marketing. While most marketing problems are interdisciplinary, the field is often fragmented. By involving skills and ideas from each of the subareas of marketing, text analysis has the potential to help unite the field with a common set of tools and approaches.

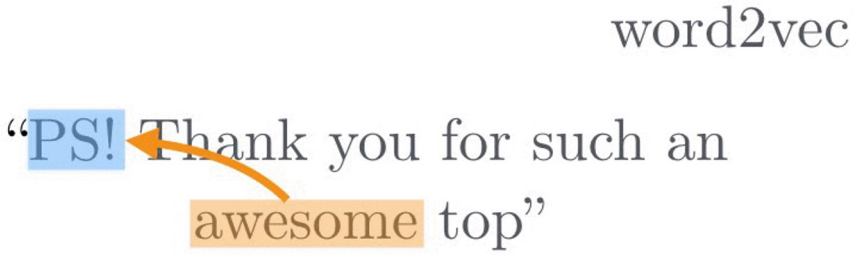
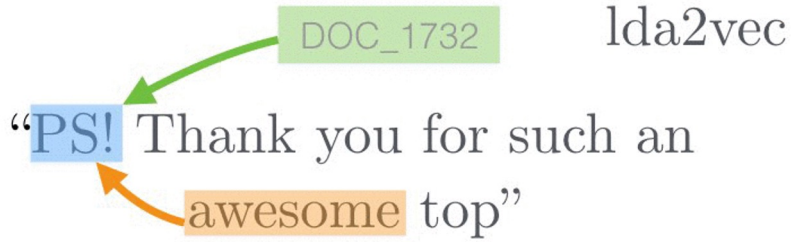
LDA with deep learning

- LDA was develop on discrete inputs (words)
  - Modified to work with dense representation (word vectors)
    - “Gaussian LDA for Topic Models with Word Embeddings”
    - http://www.aclweb.org/anthology/P15-1077
- Modified network structure and loss function to include LDA traits
  - Use like a neural network (just like how we use crf in neural networks)
  - LDA2vec

LDA2Vec

- Word2Vec estimates words around a pivot word (local information)
- LDA estimates words from a document topic (global information)
- LDA2Vec estimates words using both information





https://multithreaded.stitchfix.com/blog/2016/05/27/lda2vec/

LDA2Vec

- Combines advantages from LDA and Word2Vec
  - Combine global info with local info

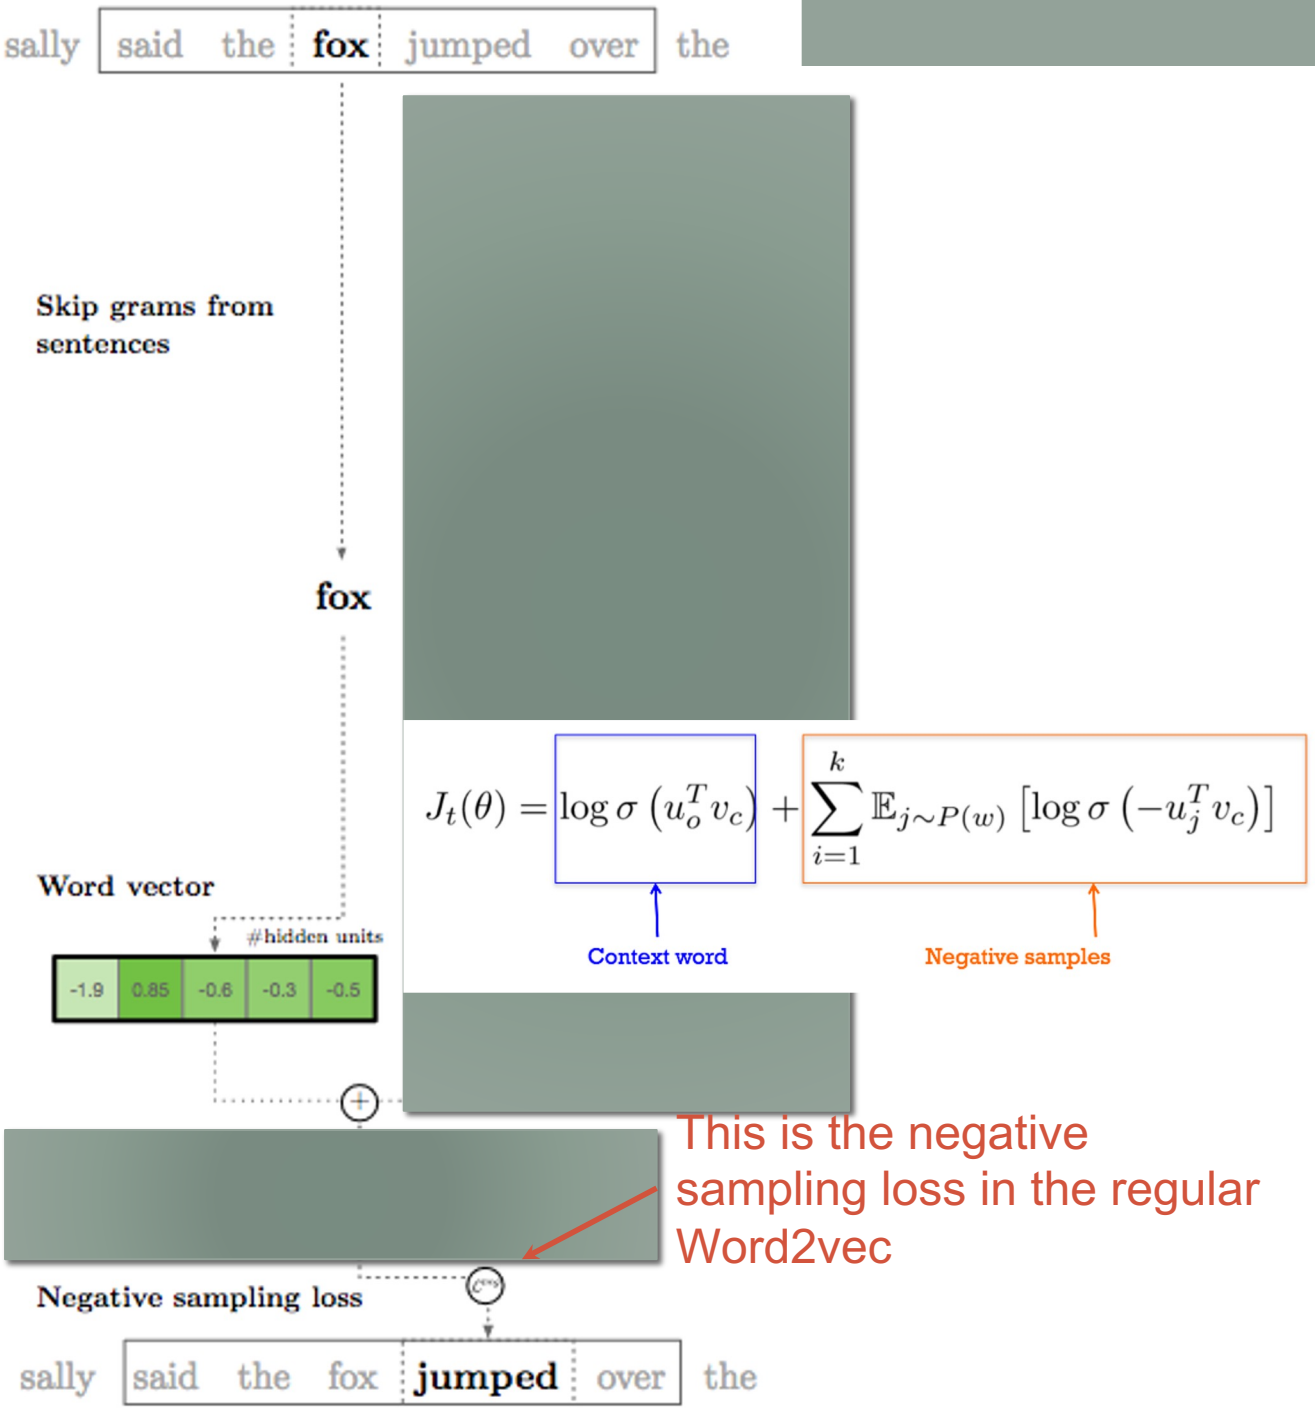
  Word German + airline topic = Lufthansa
  - Dense word vector but sparse document vectors

  Apple = [0.2 -1.2 -2.1 1.5]

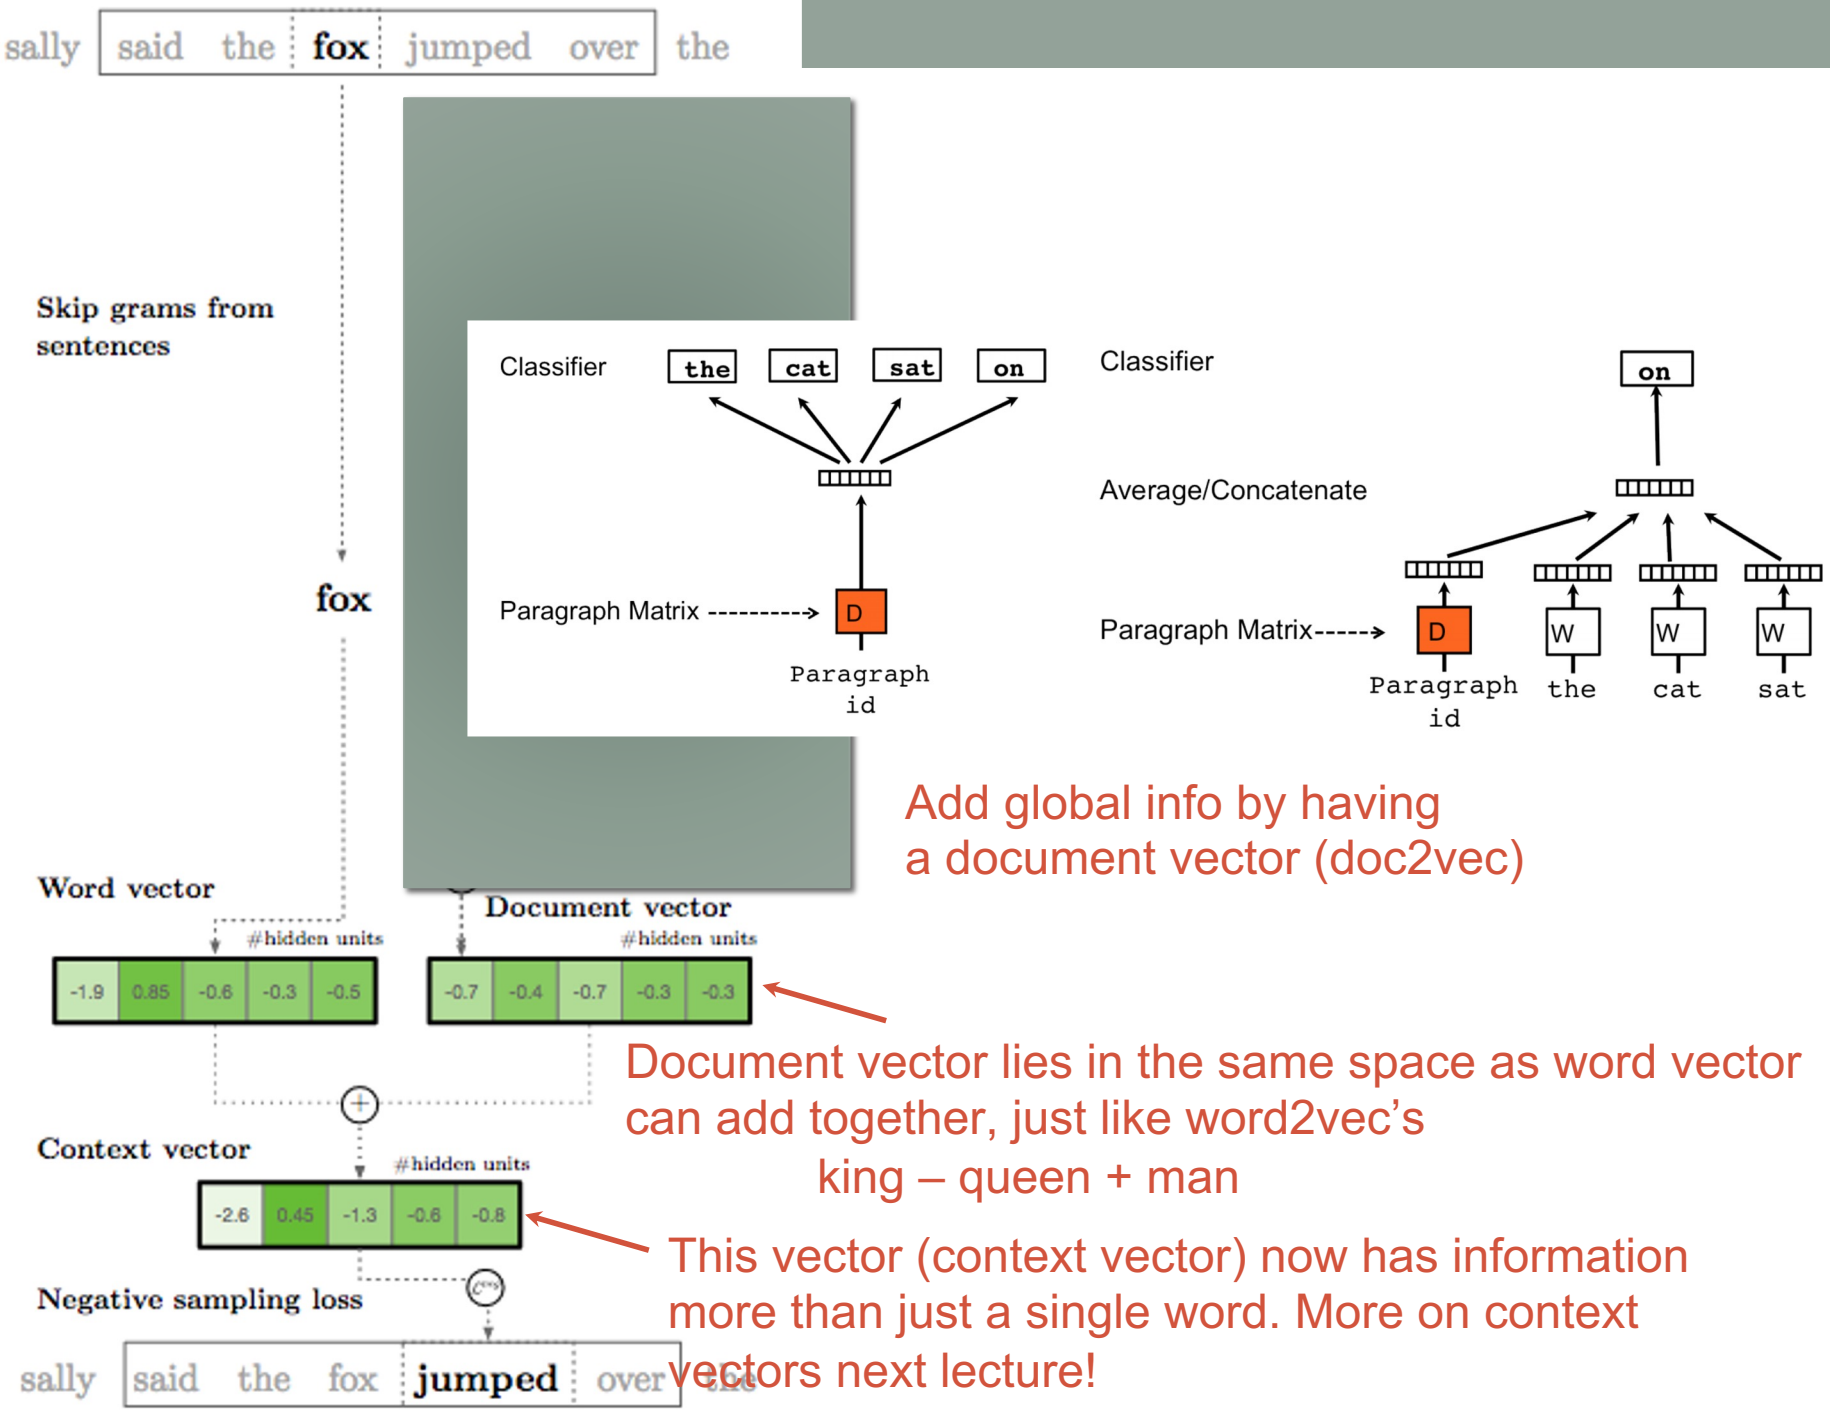
  Doc1 = [80% 20% 0% 0%]
  - Mixture of topics for each document vector give interpretability for humans

A typical skip-gram with negative sampling
A word is transformed to a word vector

Maximize dot product between pivot word and context words
while reducing dot product between pivot word and negative sampled words



This is the negative sampling loss in the regular Word2vec

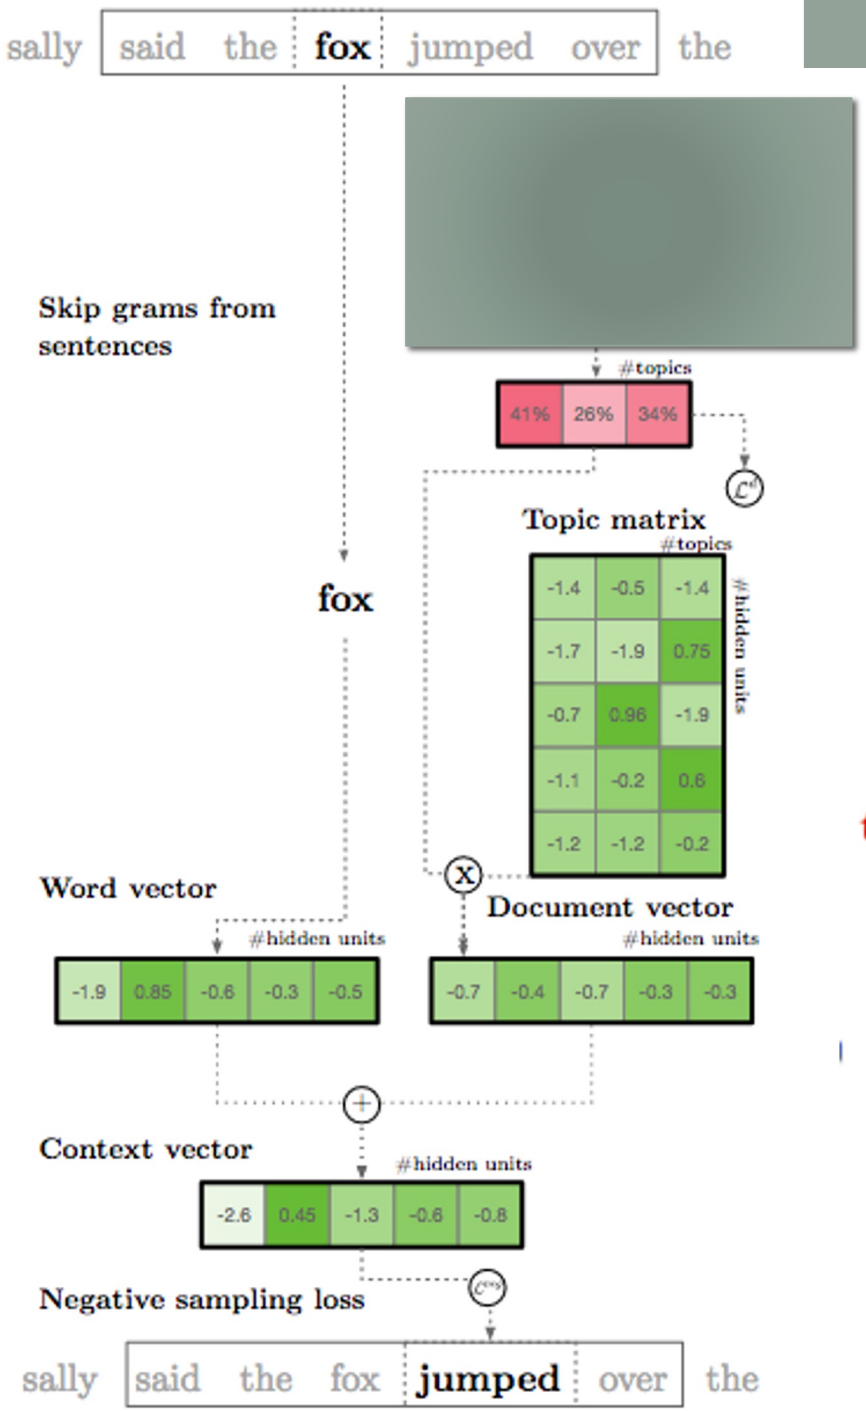


Add global info by having a document vector (doc2vec)

Document vector lies in the same space as word vector can add together, just like word2vec's

king – queen + man

This vector (context vector) now has information more than just a single word. More on context vectors next lecture!



Just like how we model a topic mixture
$p(w) = \Sigma p(topic)p(w|topic)$
We can model a document vector as
$\Sigma p(topic)*TopicVector$

Topic vector lies in the same space as word vectors

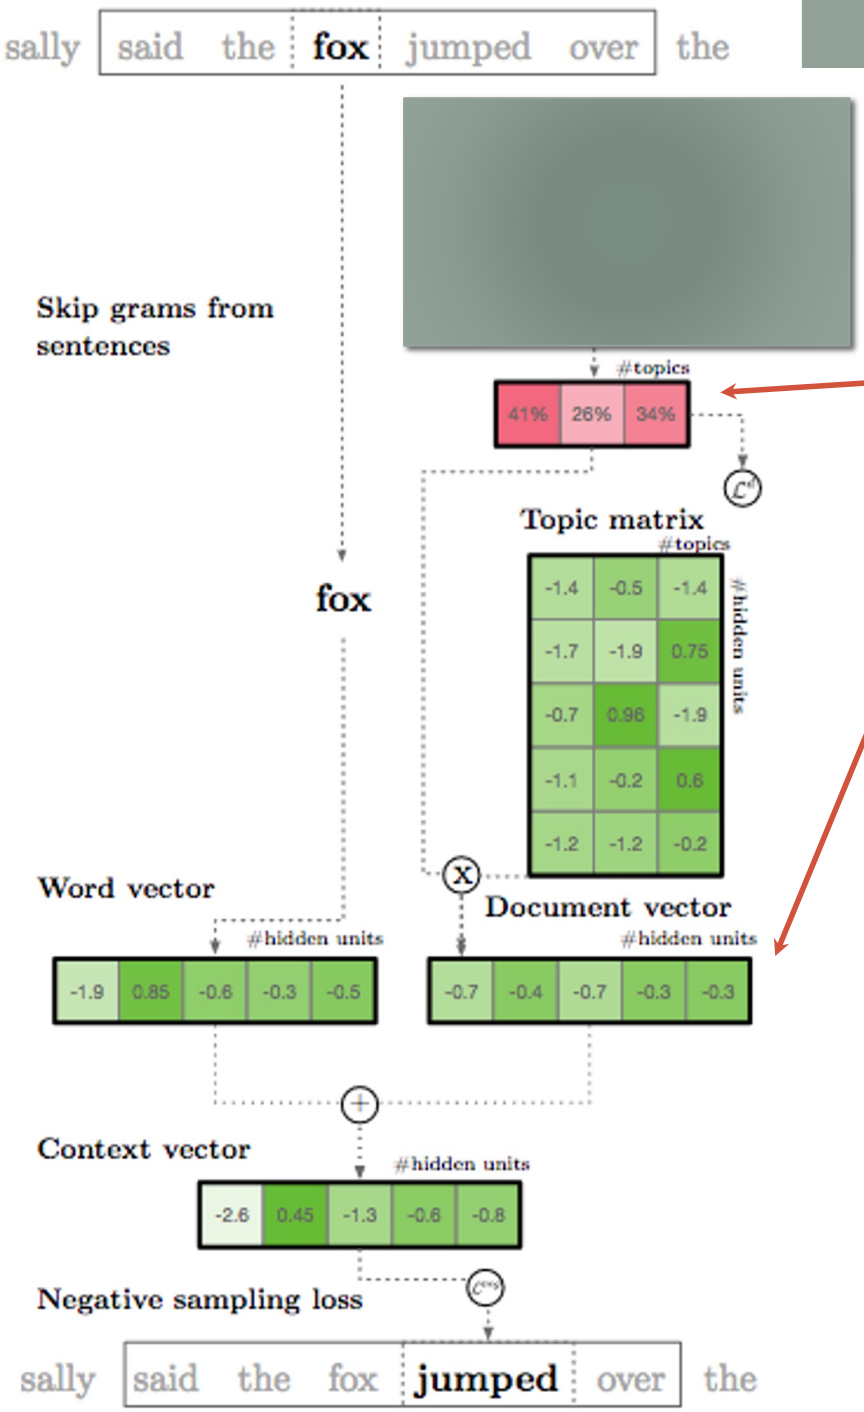
Adding word vectors yields document vectors that lies in the word vector space

topic 2 = "politics"

Milosevic
absentee
Indonesia
Lebanese
Isrealis
Karadzic

topic 1 = "religion"

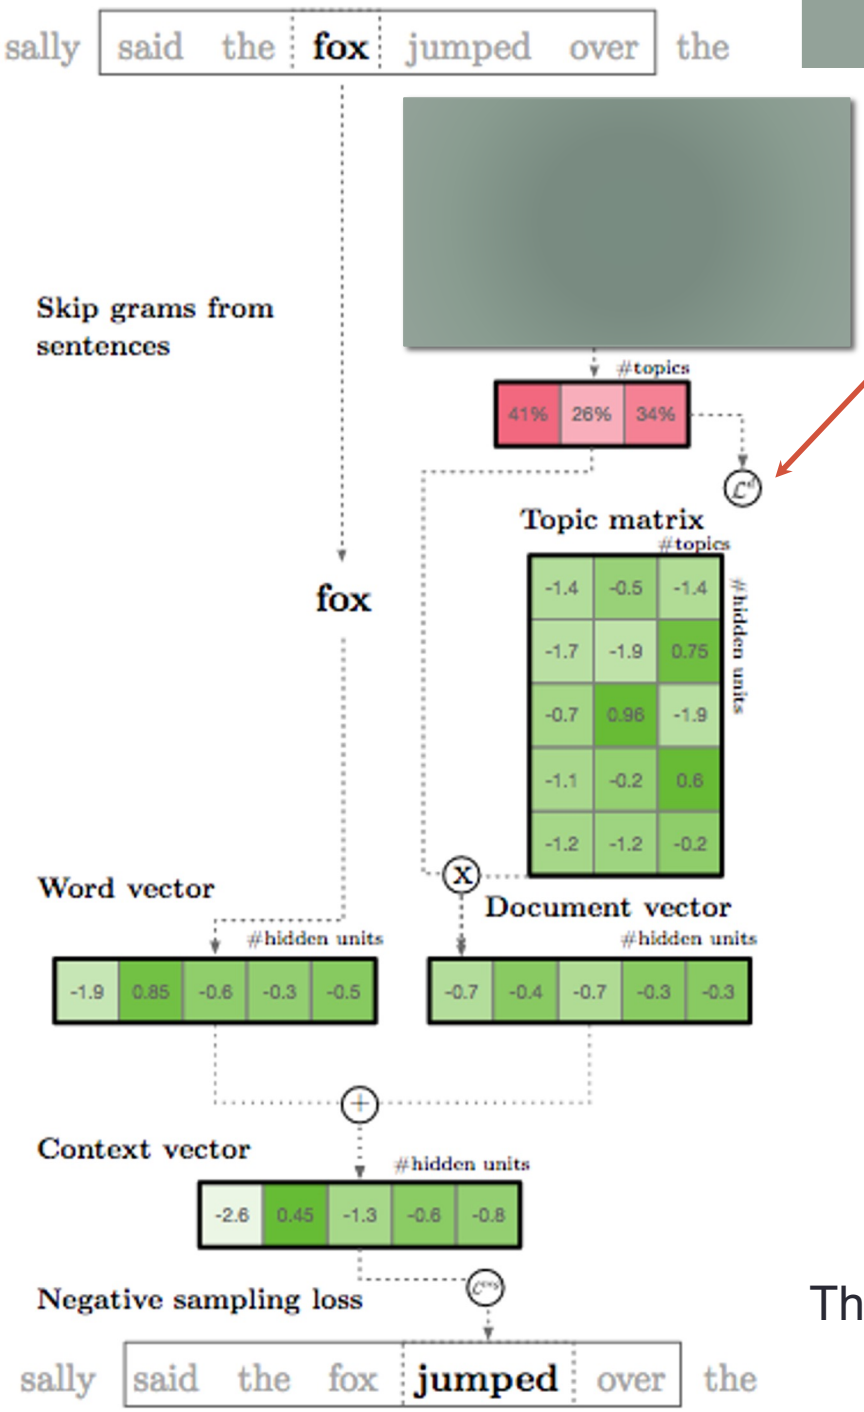
Trinitarian
baptismal
Pentecostals
Bede
schismatics
excommunication



This construction give explicit meaning to document vectors (valid probabilities)

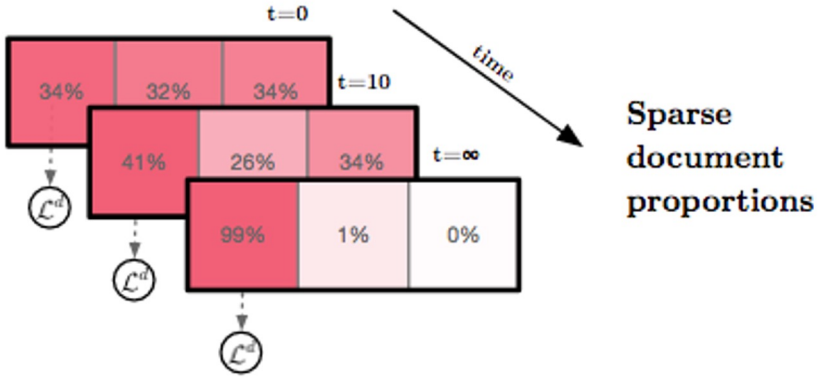
Instead of a bunch of numbers

However, we further prefer sparse topic probabilities for even better interpretability



Add a loss term to include the Dirichlet loss which prefers sparse topics

Mixture prob becomes spares as training evolves

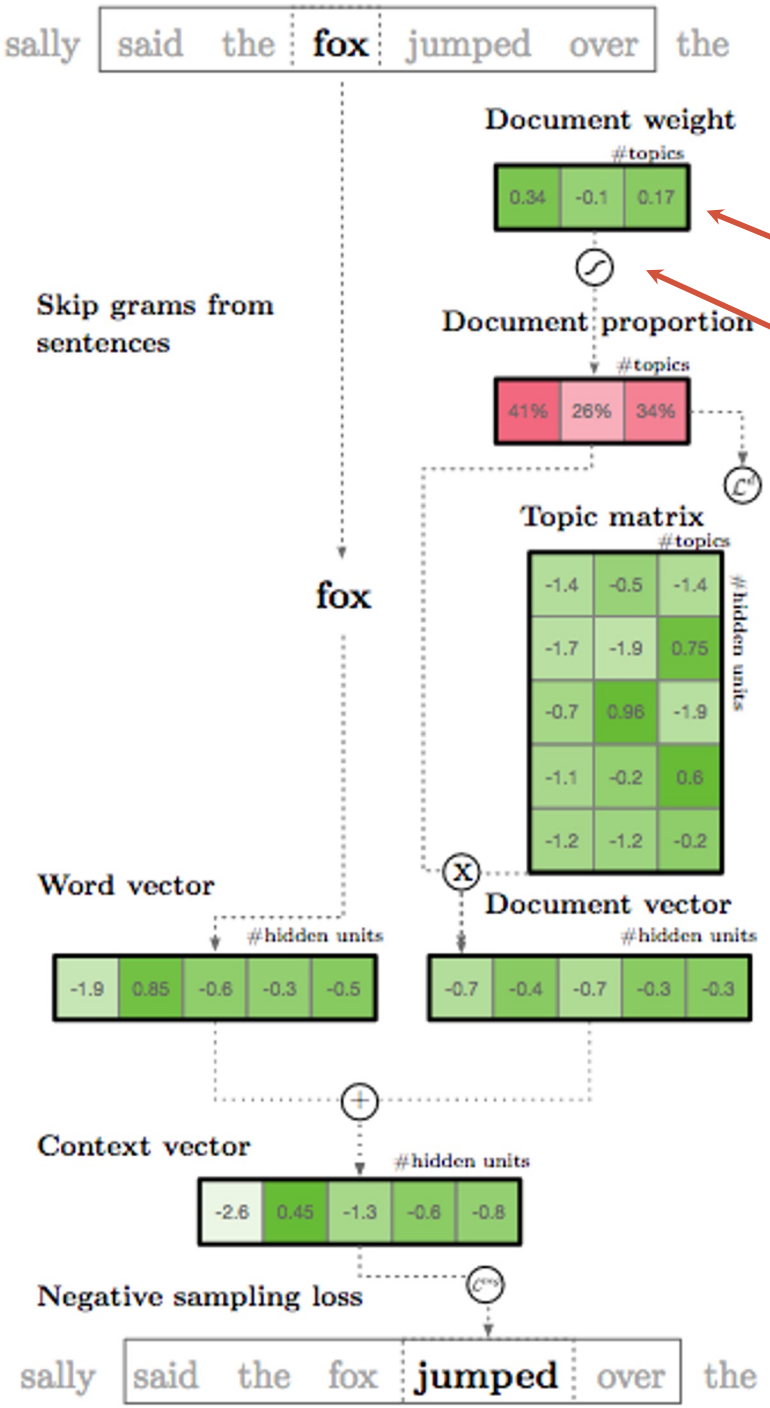


$$\mathcal{L}^d = \lambda \Sigma_{jk} (\alpha - 1) \log p_{jk}$$

$$\alpha = n^{-1}$$

n is number of topics

This loss prefers a couple of high value p



To ensure the topics proportion is a prob, Document weight is initialized and learned

The weight is transformed to prob using a softmax

Overall loss function

- Loss from skip-gram and Dirichlet

Dirichlet loss

$$\mathcal{L} = \Sigma_{\text{word pairs } (i,j)} [\sigma(\vec{c_j} \cdot \vec{w_i}) + \sigma(-\vec{c_j} \cdot \vec{w_{negative}})] + \Sigma_{\text{documents } k} \, log \, q(d_k|\alpha)$$

Skip-gram loss

$$\vec{c_j} = \vec{w_j} + \vec{d_j}$$

Context = word + document vector

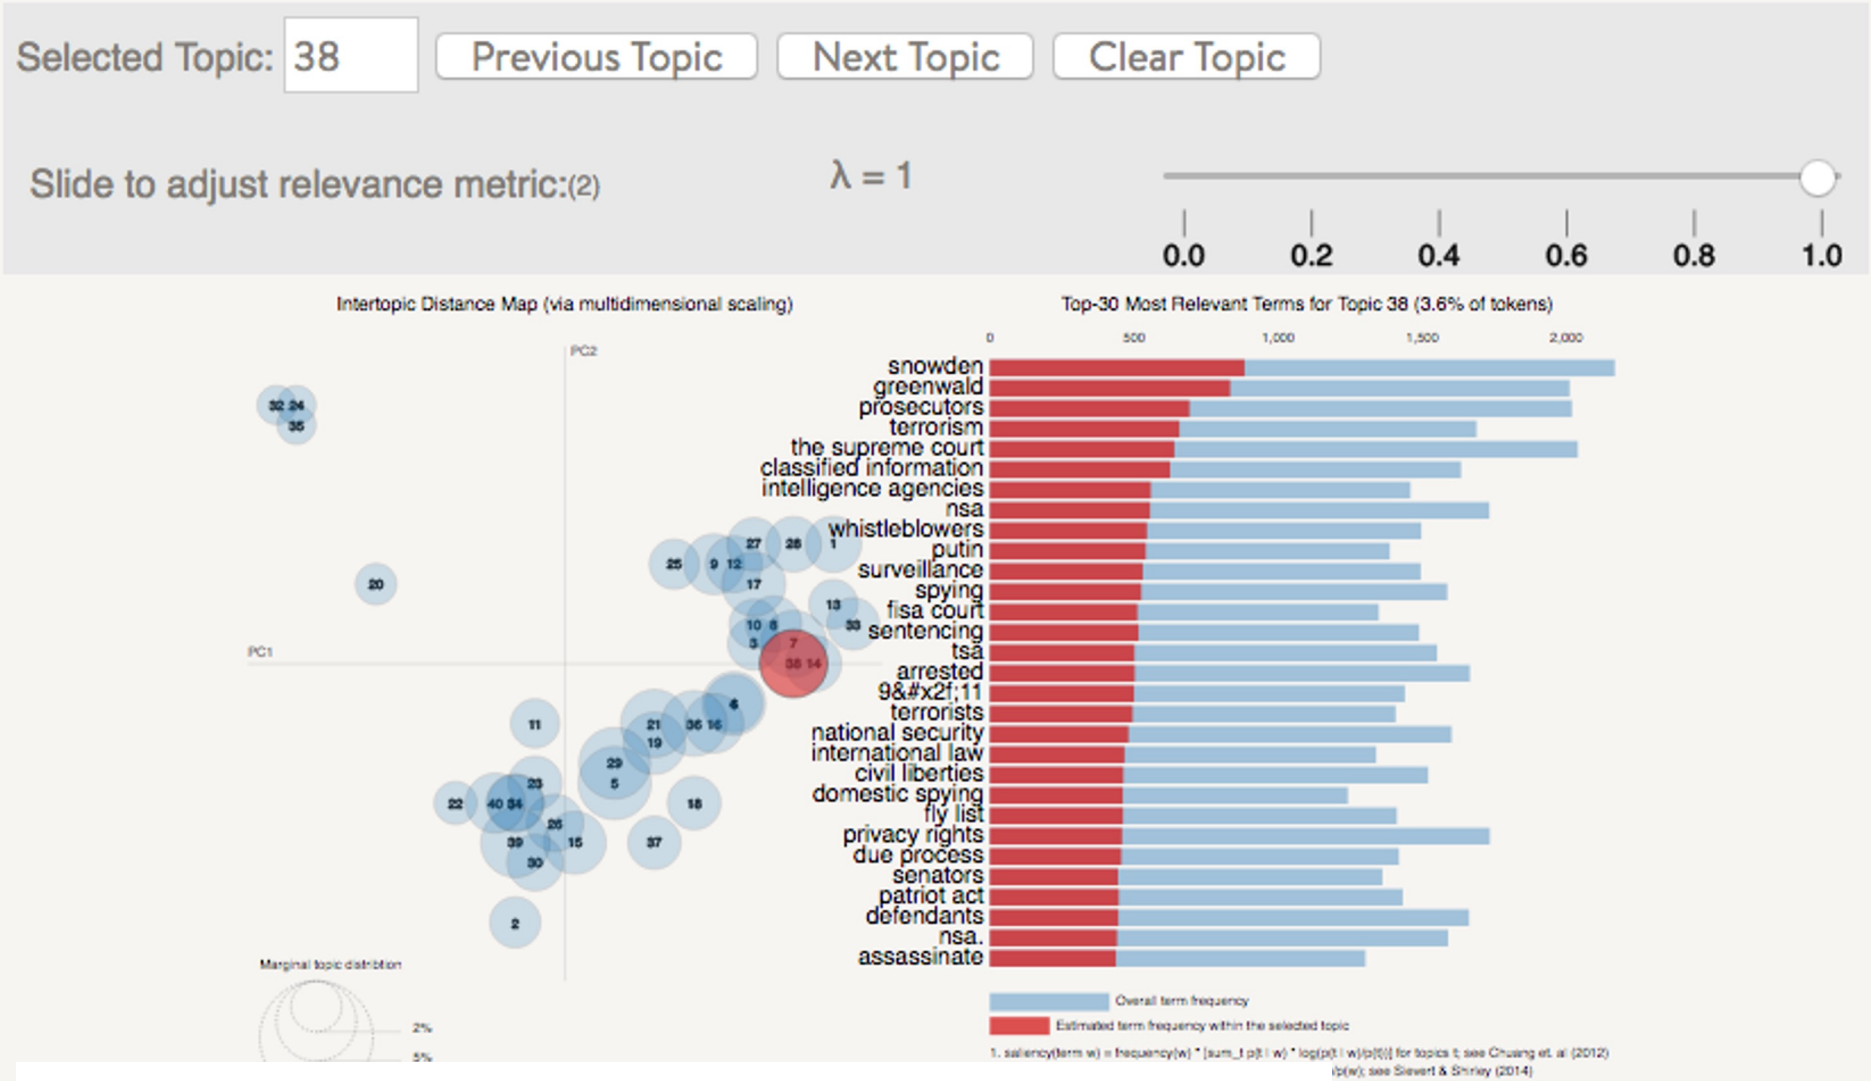
$$\vec{d_j} = a_{j0} \cdot \vec{t_0} + a_{j1} \cdot \vec{t_1} + \ldots$$

Document vector is mixture of topics

$$q(d_k|\alpha) = \Sigma_k(\alpha_k - 1) log a_k$$

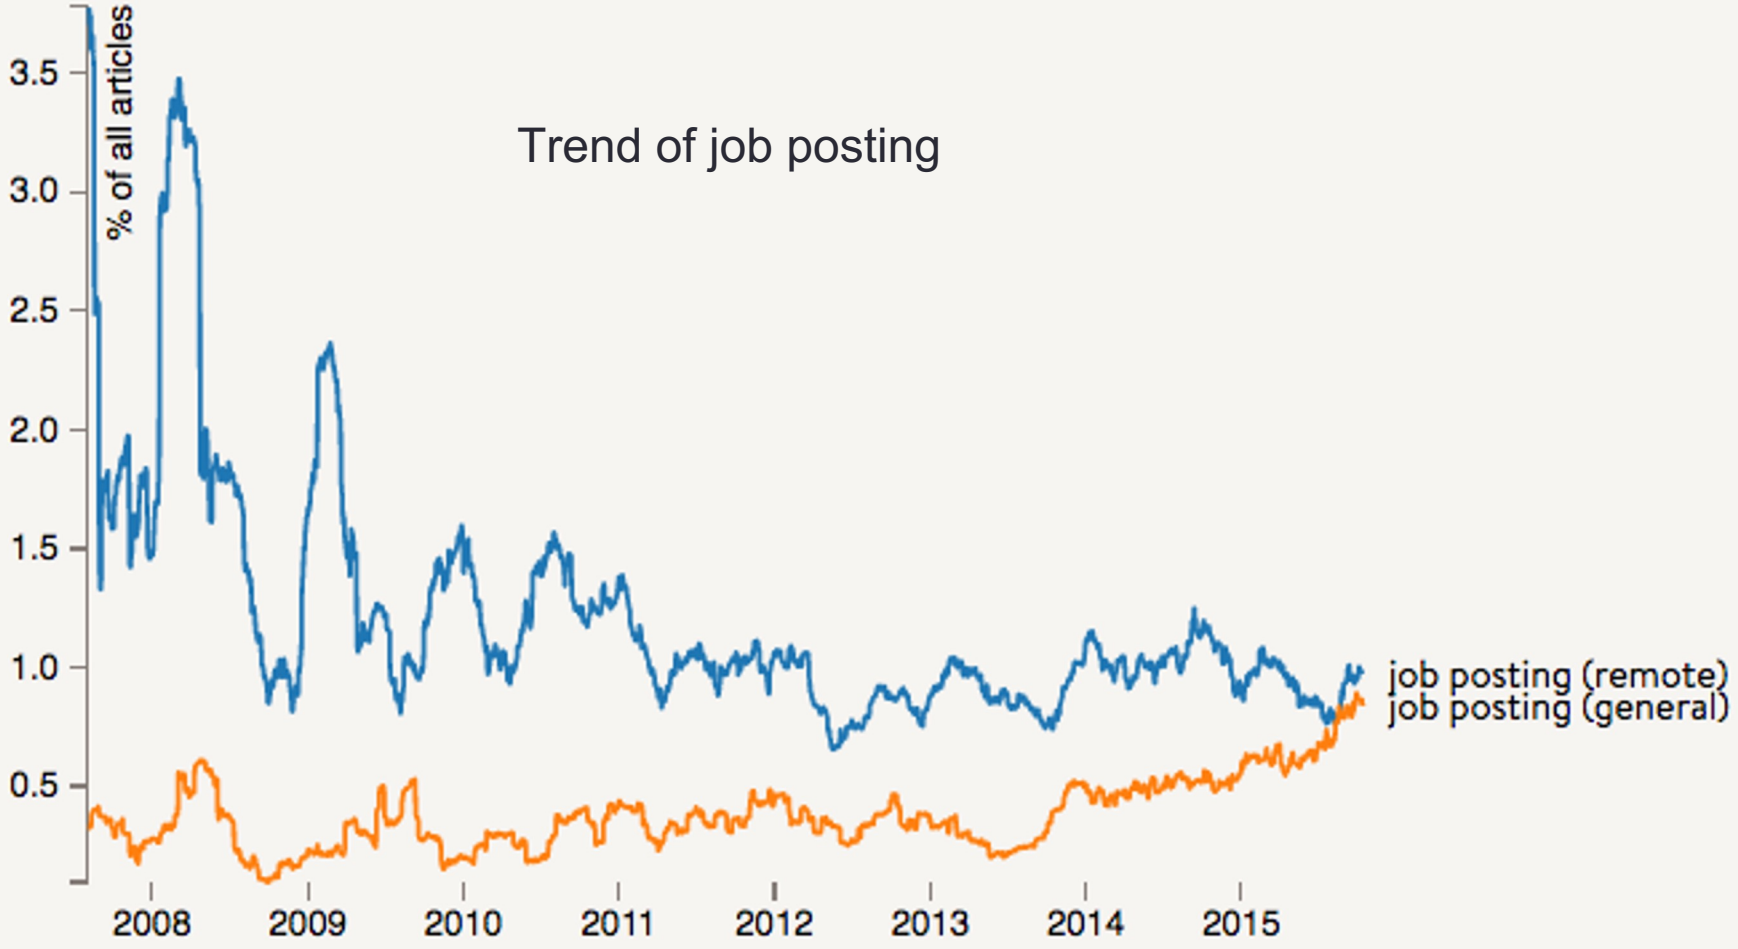
Dirichlet likelihood term

LDA2Vec example

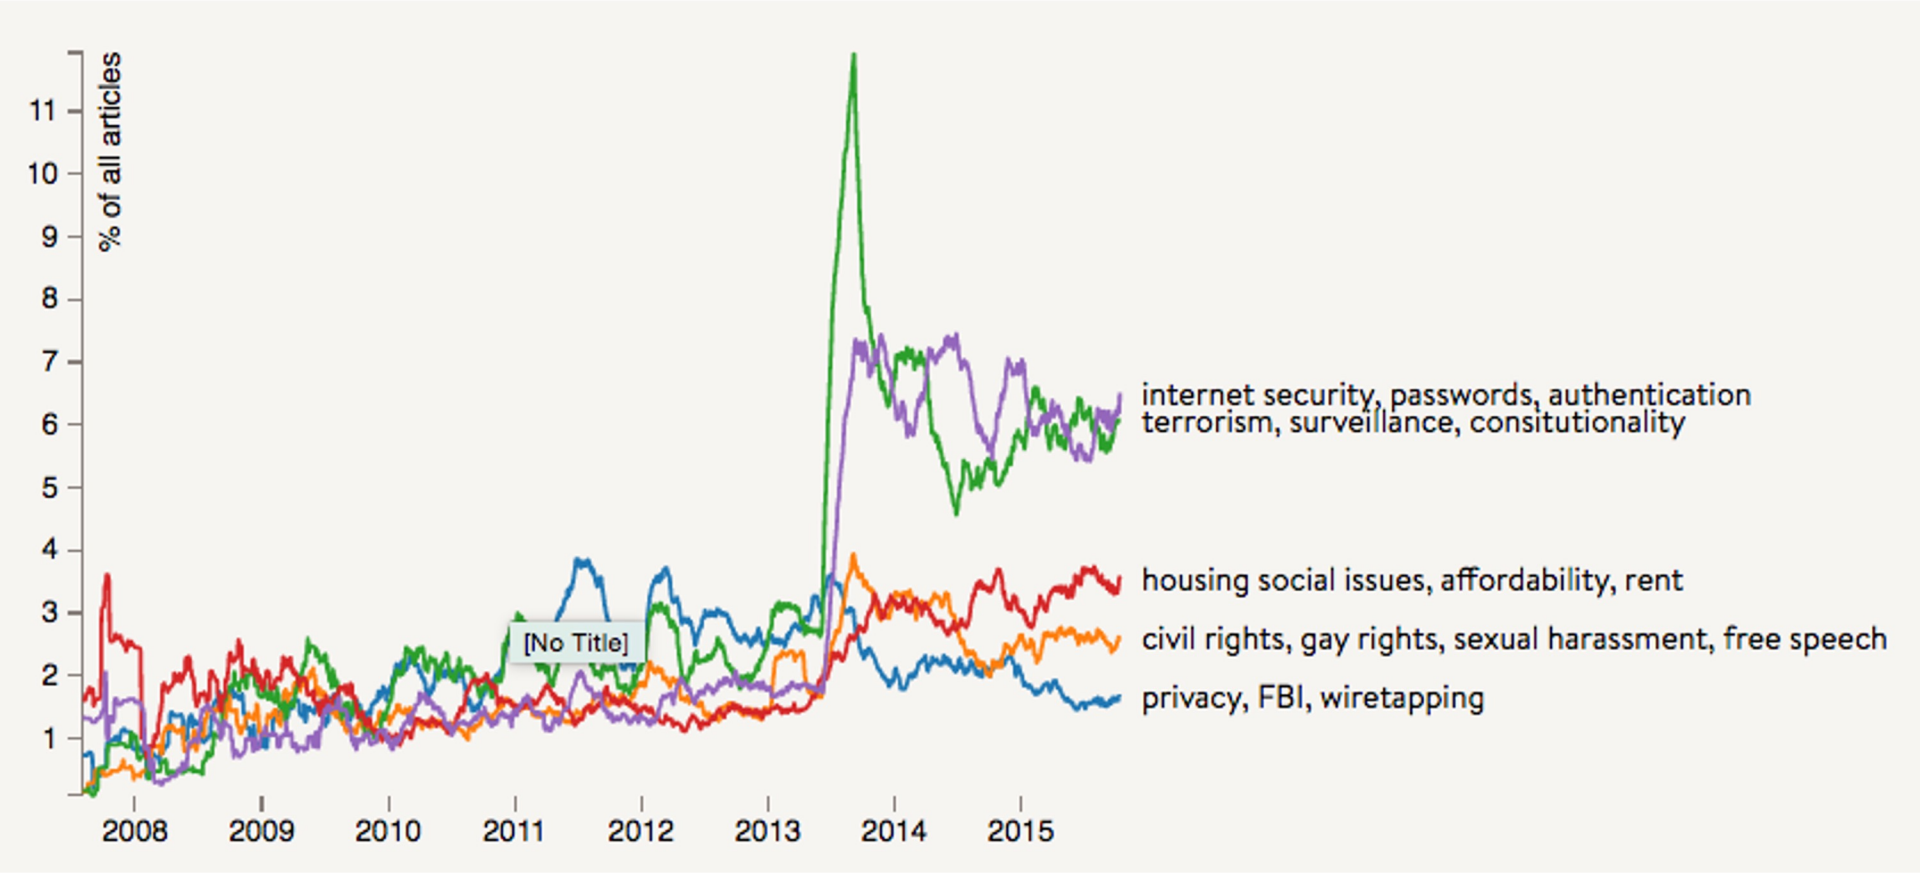


https://multithreaded.stitchfix.com/blog/2016/05/27/lda2vec/

LDA2Vec example



Politics trend



LDA2Vec as a classification model

- Maybe not…
  - Model that offers human interpretability usually is worse
- But it's great for
  - Extract insights from trends by visualizations
  - Completely unsupervised model
    - Except for the need to specify number of topics and look through each topic words to determine the topic label
- This model gives a good example of
  - The design decisions for model building can be complex but logically motivated
  - Combining loss functions to get the desired behavior

Summary

- Text classification task
- Bag of words model
  - Naïve Bayes
  - Topic Models
    - Latent topic models (LDA)
  - LDA2vec
- Context vectors
  - USE
  - More next lectures
